ВСТУП

Навчальний посібник "English for Technical Students" («Англійська мова для студентів технічних ВНЗ») призначений для студентів, які починають навчання в технічному ВНЗ. Тому поряд з загальновживаною лексикою і повсякденними розмовними виразами, які, безумовно, необхідні фахівцям будь-якої сфери, студенти зможуть опанувати також і спеціальну лексику, набути навичок читання фахових текстів, підвищити рівень володіння усним та писемним мовленням за рахунок повторення граматичних структур і моделей.

Посібник відповідає програмі вивчення іноземної мови у технічному ВНЗ і вимогам необхідного кваліфікаційного рівня. Він складається з п'яти розділів (модулів), кожний з яких містить матеріал, об'єднаний загальною тематикою. Це «Персональна ідентифікація», «Соціальні контакти», «Україна в Європейському освітньому просторі», «Європейський та міжнародний освітній простір», «Екологія». Кожний розділ, в свою чергу, поділяється на декілька занять. У кожному підрозділі, що складає одне заняття, студенти знайдуть матеріали для вдосконалення усного мовлення, читання, письма, короткий граматичний довідник з вправами, а також домашнє завдання. Структура всіх занять є однотипною, що дозволяє студентам планувати свій час і зусилля.

Для підвищення привабливості посібник споряджений численними ілюстраціями, жартами, анекдотами, прислів'ями та приказками, а також додатковими автентичними текстами, пов'язаними з темою заняття. У розділі "Supplementary Reading" зібрано низку оригінальних текстів, які можуть бути використані для опанування спеціальної лексики та розмовних моделей студентами різних спеціальностей.

Автори вдячні викладачам кафедри іноземних мов НТУ «ХПІ» за допомогу в підборі матеріалів та цінні зауваження.

Lesson 2. My Family 2.1. Усна тема. Моя сім'я

O Active Vocabulary:

friendly – дружний; surgeon – хірург; neither ... nor – ні ... ні; handsome – красивий (про чоловіків); grey – сивий; sociable – товариський; overtime – понаднормово; nursery school – дитячий садок; nephew – племінник; separately – окремо.

Now I am going to tell you about my family. We are a family of five. We think we are a large, friendly and united family. So we are happy to be living together and getting on all right.

To begin with, I am going to talk about my dad. His name is Sergey Petrovich. He is 45. He works as a surgeon in a hospital. He is neither old, nor young. He is a good-looking man, handsome, rather thin with dark brown hair just beginning to get grey. He is a very sociable person. What I don't like about my father is that he is always busy. He works overtime very often. He is a breadmaker in our family. He is fond of going to the country on weekends, because he enjoys working in the garden.

My mother's name is Galina Nickolayevna. She is three years younger than my father. She works as a teacher at a nursery school. My mother is rather slim and pretty; she is always elegant and smart. In short, she is a pleasant-looking woman of about 40. She always has a lot of work to do at school and about the house. She is fond of her work and spends a lot of time there. But she has to cook the food for all the family at home. Shopping and cooking is nearly half a day's work for her. But my granny and I have a habit of helping her about the house.

Boris is my elder brother. He is six years my senior. So he is 23 already. He has graduated from the University and he works as an economist now. He is married. His wife is a journalist. They are three in the family. They have got a child, my nephew. It is a lovely little boy of two with golden hair and dark blue eyes. He is full of joy and gaiety. My brother's family lives separately.

And finally, a few words about my grandmother. My granny is my best friend, I must tell you. She is always ready to listen to my endless stories about my school life and my friends. She is retired now, but in her youth and her older age she worked as a teacher at school. She is a very understanding person, I must admit.

Put it into a few words, we are a united and friendly family.

<mark>0</mark> Запам'ятайте!

orphan – сирота; aunt – тітка; uncle – дядько; niece – племінниця; half-sister – зведена сестра; half-brother – зведений брат; mother-in-law – теща, свекруха; father-in-law – тесть, свекор; brother-in-law – зять, шурин, дівер; sister-in-law – невістка, своячениця; stepmother – мачуха; stepfather – вітчим; widow – вдова; widower – вдівець; fiance – наречений; fiancee – наречена; housewife – домогосподарка.

Вправа 1. Доповніть речення інформацією про свою сім'ю.

Young Organist

Back in 2002, when former church organist David Christianson purchased an Oberlinger organ for his home, he thought maybe he would play from time to time to relax. But, as it turns out, he can't do it. That's because his then 7-year-old daughter Karen liked this impressive instrument and devoted her life to classical music. Now, after hours of practice during eight years, 15-year-old Karen is one of the youngest organ virtuosos in the country. She recently made her radio debut on National Public Radio's "From the Top" show.

Karen's parents, David and Anastasia, said they had known since a very early age that Karen was musically inclined. "She was very skilled on the piano, even at the age of six," said Anastasia.

At first, she learned to play from her father. But within a year, Karen started studying at the organ department at the Curtis Institute of Music in Philadelphia.

At the age of 8, she gave her first public performance at the historic Christ Church in Philadelphia. Soon after, she performed her first solo recital, playing a selection of Bach in honor of his birthday. By the age of 9, she was composing original works.

In the sixth-grade, she played in Notre Dame de Paris for acclaimed organist Olivier Latry. In 2010 alone, she performed in Atlanta, San Francisco, Athens, the Netherlands, New York and Abilene. And she's got a full calendar already for 2011.

In the summer of 2009, Karen had a recital in Rhode Island. Her younger brother, Nicholas, an accomplished cellist, had a recital in Washington, DC, on the same day.

Despite her practice between 8-10 hours a week and tight schedule, she has a full load of academic and extracurricular activities without missing them.

And on top of all that, she still finds time to be a pretty normal teenager. She loves sailing and soccer. She is never far from her iPod, which holds an eclectic mix of Rock, Pop, Country and, of course, classical. And, as she looks toward her critical junior year at Episcopal Academy, her thoughts are turning to college and beyond.

Though she is still debating whether she'll pursue music therapy or teaching, she knows that touching others with music will definitely be a part of her future.

Teen Scientist Gets High Honor from Obamas

Li Boynton, 18, a senior at Bellaire High School, says meeting the president and first lady in White House will top the stack of academic honors she has accumulated.

In the fifth grade, Li Boynton built a device that removed salt from seawater. In the 11th grade she created a cheap method of testing for water contaminants.

Along the way, the Bellaire High School senior racked up \$50,000 in college scholarships, won top honors in the Intel International Science and Engineering Fair, became a semifinalist in Intel's Science Talent Search and was accepted to Yale University.

Biology teacher Anna Loonam, who taught Boynton as a freshman and again as a junior, called her "a top science student." Art teacher Jo Zider has described her as "one who looks deeply into the mystery of life." An entire class of younger science students appreciates her, too.

Boynton's premier achievement as a young scientist was creation of a method to test for water pollutants by using light-generating bacteria. The student found that the microscopic organisms generated less light as the water's toxicity grew.

By placing a bacterial culture in a light-tight box with a digital camera and processing the results through a free computer program, Boynton was able to reliably and cheaply test for half a dozen common pollutants. The technology won top science and engineering fair honors.

Boynton, who hopes to become a medical doctor or researcher or both, credits her mother, Laura Luo, a financial manager; her father, John Boynton, an aeronautical engineer; and her stepfather, Robert Pearson, a computer science expert, for supporting her academic interests.

Accepted by Yale, Li recently also applied to Harvard University.

Outside the classroom, she enjoys socializing on Web social sites and shopping. Sports, she said, hold little charm. "Physical education is one of my worst classes. I failed pushups."

Структура There is ... There are ...

Є найбільш поширеною конструкцією з дієсловом *to be* (в різних часових формах). Вона використовується, коли треба повідомити, що деякий об'єкт знаходиться в певному місці. Англійське речення в такому випадку перекладається з кінця (з обставини місця). Наприклад:

There is a printer on the desk. – На столі стоїть принтер.

There are lots of formulae in this textbook. — **B** цьому підручнику багато формул.

Якщо обставина місця відсутня, то речення перекладдається, починаючи з дієслова:

There is only one solution of this problem. – Існує тільки одне рішення цієї проблеми.

Питальна форма.

Is there a printer in your office? – У вашому офісі ϵ принтер?

Lesson 4. Outstanding Scientists 4.1. Усна тема. Біографія видатної людини D.I. Mendelevev (1834—1907)

Dmitry Ivanovich Mendeleyev is a famous Russian chemist. He is best known for his development of the periodic table of the properties of the chemical elements. This table displays that elements' properties change periodically when they are arranged according to atomic weight.

Mendeleyev was born in 1834 in Tobolsk, Siberia. He studied chemistry at the University of St. Petersburg, and in 1859 he was sent to study at the University of Heidelberg. Mendeleyev returned to St. Petersburg and became Professor of Chemistry at the Technical Institute in 1863. He became Professor of General Chemistry at the University of St. Petersburg in 1866. Mendeleyev was a well-known teacher, and, because there was no good textbook in chemistry at that time, he wrote the two-volume "Principles of Chemistry" which became a classic textbook in chemistry. In this book Mendeleyev tried to classify the elements

according to their chemical properties. In 1869 he published the first version of his periodic table of elements. In 1871 he published an improved version of the periodic table, in which he left gaps for elements that were not known at that time. His table and theories were proved later when three predicted elements: gallium, germanium, and scandium were discovered.

Mendeleyev investigated the chemical theory of solution. He found out that the best proportion of alcohol and water in vodka is 40 %. He also investigated the thermal expansion of liquids and the nature of petroleum.

In 1893 he became the director of the Bureau of Weights and Measures in St. Petersburg and held this position until his death in 1907.

Утворення кількісних числівників

Другий десяток: закінчення *-teen* – 13 – 19 (*thir<u>teen</u>* ... *nine<u>teen</u>*).

Десятки: закінчення -ty - 20 - 90 (twenty ... ninety).

Тризначні числівники утворюються за зразком: 356 – *three hundred and fifty-six*.

Кожні три розряди чисел (справа наліво) відокремлюються комою: 2,437; 5,789,240.

Утворення порядкових числівників

Закінчення <u>-th</u> – six<u>th</u>, thirteen<u>th</u>, twenty-four<u>th.</u>

Виняток: 1st – the first, 2nd – the second, 3rd – the third.

О Запам'ятайте!

У числівників *five* and *twelve* букви *ve* змінюються на f – *fifth*, *twelfth*; до числівника *eight* додається лише буква h – *eighth*; у числівника *nine* пропускається остання буква -e – *ninth*; у числівників, що позначають десятки, кінцева буква y змінюється на *ie*: *twenty* – *twentieth*, *fifty* – *fiftieth*.

Роки читаються так:

1989 – nineteen eighty-nine

1905 – nineteen [ou] five

1700 – seventeen hundred

2005 – two thousand five (twenty hundred and five)

Дати: 14 січня – the fourteenth of January, January the fourteenth 14-го січня – on the fourteenth of January

Lesson 5. Students' Life 5.1. Усна тема. Моє студентське життя STUDENT'S WORKING DAY

Hi! As you know, I am a first-year student of the University.

Now, let me describe my usual working day. My classes begin at eight thirty. So, on weekdays I have to get up at half past seven. My alarm clock usually wakes me up and my working day begins. I turn on the radio, do my morning exercises, take a shower and brush my teeth. After that I get dressed and comb my hair. Then I have breakfast. I love to listen to the latest news on the radio while I am eating.

I leave the house at ten minutes to eight and walk to the nearest bus stop. I live rather far from the University and it usually takes me about a quarter of an hour to get there by bus. Sometimes when the weather is fine and I have enough time I walk to the University.

As a rule we have three or four classes a day. We have lectures in different subjects. Usually I don't miss my classes because I want to pass my examinations successfully. But sometimes I do, especially when the weather is fine and the classes are boring.

At twelve o'clock we have a big break for lunch. That's my favourite time. That is the time to share the latest news with my friends. I prefer not to go to the canteen and we often have lunch in a small cafe not far from the University. At one o'clock we have to be back to our classes. During the working day we also have several short breaks that last for ten minutes.

From time to time I have to stay at the University till late evening because I go to the library to get ready for my practical classes or to write a report. As a rule I have no free time on weekdays. So, by the end of the week I get very tired.

I come home at about 6 o'clock in the evening. My parents are already at home. We have supper together. After supper we wash up, have coffee or tea and watch TV. I prefer old comedies and serials or films about travelling. Sometimes I go for a walk in the park or visit my friends.

At about eleven p.m. I go to bed. I like to read something before going to bed or to listen to some music. Sometimes I fall asleep while I am reading.

Jack lives in a hostel. He gets up at eight o'clock in the morning. He goes to classes at nine o'clock. His classes usually last till 2 p.m. In the afternoon he studies in the library. He does his homework in the evening. He sometimes goes to the cinema on Saturdays. He has many friends and visits them on Sundays. Usually they play football – regardless of the weather – and sometimes they go cycling in the country.

Pete does not live in the hostel, he lives with his parents. He does not go to the Institute on Tuesdays and Thursdays. He goes to the laboratory and works there till six o'clock on these days. He has a lot of friends. They seldom go to

the cinema but they like concerts. Pete usually does his homework from 7 till 9 o'clock p.m. Pete doesn't go in for any sports. He thinks it takes too much time, and he wants to devote himself to science.

Мій друг – також студент нашого університету. Він звичайно дістається до університету автобусом і витрачає на це півтори години. Він встає дуже рано, щоб не запізнитися на заняття. О першій дня у нас звичайно обід. Він обідає в їдальні. Я не ходжу в їдальню.

Я живу у гуртожитку. Я повертаюсь з університету о 7-й вечора, вечеряю, іноді дивлюсь цікавий фільм. Перед сном я люблю трохи погуляти. Часто до мене приходять одногрупники. Минулої неділі ми ходили з ними в парк. Нам дуже сподобалася наша прогулянка.

Lesson 6. Hobby 6.1. Усна тема. Моє хобі МУ НОВВУ

What is a hobby? It is what you can and like to do, when you have free time. We choose a hobby according to our character and taste. When we have a hobby, our life becomes more interesting. Very often our hobby helps us to choose our future profession because we learn a lot of new things. Many people are interested in music. They collect records. Others like to read and collect books. People living in cities and towns like to be closer to nature and they spend their free time in the country. Some of us go on hikes, others prefer working in their gardens, taking photographs or knitting. For example, gardening and growing roses is the most common hobby among Englishmen.

Вправа 1. Складіть розповідь про своє хобі, використовуючи такі фрази.

When I have free (spare) time ...; I have chosen my hobby because ...; I started ... when I was ...; I like (to do) / like (doing) ...; I prefer (doing something) ...; I am interested in (something) (doing something) ...; I am fond of (something); The most common hobby among (somebody) is ...; My hobby plays an important part in ...; I spend much (little) time on (doing something); I'm keen on (something) (doing something); I'm into (something) (doing something); I enjoy (something) (doing something); I relax by (doing something).

An Unusual Hobby

Hi, I'm Ron Hawker. I started riding the unicycle when I was 11 years old. My mother gave me a unicycle as a Christmas present. I have never been a good athlete, so it took me a long time to learn how to ride. At first, my mother used to fight me because all the walls of my house were decorated with my finger-prints.

In a month, I could ride around the block (about half a mile) falling about 3 times. It took me several weeks to learn how to freemount. I taught my brother and a couple of my friends unicycling. Since the first day, my father was extremely supportive and always found ways to keep me involved in different unicycling activities.

Training for my first unicycling competition was interesting. My coach David used to wake me up at 5:00 a.m. every morning, to run 5 miles. At first it was very hard and even I was not sure if the whole thing was worth it ... now I know that it definitely was.

A few months later, I went with my father to Nassau County, in Long Island, New York. I never thought I was good enough to compete in an international competition. When the race started, I decided to do what my trainer, David, told me: I had to follow the first rider in order to have him (her) cut the wind. At the end of the race, I discovered that I could go faster than the first rider and I decided to pass her. As I was passing her, I fell from my unicycle but I managed to get back on and still win the race. I was VERY excited. That was my first international race and I won!!!

Для відповіді: Cross the street; Go straight on; Right down the street; Across the square; Keep to the left (right); Turn left (right); Take bus (tram).

7.2. Читання

Прочитайте та перекладіть текст рідною мовою. Складіть власну розповідь про подорож літаком, використовуючи підкреслені вирази.

Travelling by Air

O Active Vocabulary:

to travel – подорожувати; to fly – літати; a flight – рейс; to catch a plane – встигнути на літак; to miss a plane – запізнитись на літак; to board a plane – сідати на літак; a boarding card – посадочний талон; a handbag – ручний багаж; an airhostess (stewardess) – бортпровідниця; seat belts – пристібні ремені; to take off – злітати; to land – приземлятися; to go down – знижуватись; to be air-sick – страждати від повітряної хвороби; to arrive at one's destination – прибувати до місця призначення.

Modern life is impossible without traveling. To understand whether it is really true, you only have to go to a railway station, a port or an airport. There you will see hundreds of people hurrying to catch a train, a ship or a plane, all wanting to go somewhere and to get there as quickly as possible. For us, there is nothing like travel by air: it is more comfortable and far quicker than any other means of traveling. When you board a plane with your handbag and boarding card, the airhostess greets you and shows you to your seats. She asks the passengers to fasten their seats belts and not to smoke when the plane is on the ground,

while it is taking off or landing. She gives information about the flight (speed, altitude, to outside and so on) and offers the passengers some mineral water, lemonade or pepper mints if you are air-sick. The seats on the plane are comfortable, and you can relax either reading or looking through the window, or watching films on TV, if you don't want to sleep. When there is a long-distance flight, you'll be provided with excellent meals. Thus, the Airline Service does its best for you to enjoy the flight. Look onto the ground when the plane is going down. On and on you fly with the ever-changing scenes below – villages, fields and hills, rivers and valleys, each following the other with great speed, till you arrive at your destination and safely land at an airport. In fact, there's no better way of traveling than by air.

Some Murphy Laws For Frequent Flyers

- No flight ever leaves on time unless you are running late and need the delay to make the flight.
- If you are running late for a flight, it will depart from the farthest gate within the terminal.
- If you arrive very early for a flight, it inevitably will be delayed.
- Flights never leave from Gate #1 at any terminal in the world.
- If you must work on your flight, you will experience turbulence as soon as you touch pen to paper.
- The crying baby on board of your flight is always seated next to you.
- The less carry-on luggage space is available on an aircraft, the more carry-on luggage passengers will bring aboard.

Lesson 8. Travelling

8.1. Розмовна тема. Подорожі

O Active Vocabulary:

at the disposal – у розпорядженні; discount – знижка; journey – подорож; booking office – білетна каса; to board – сідати (у вагон, на літак); саг – вагон; compartment – купе; luggage – багаж; berth – полка в купе; departure – відправлення; charge – вартість; single (return) ticket – білет в одну (дві) сторони.

There are various means of transport at the disposal of those who travel either for pleasure or on business. If you don't like travelling on foot you can also use bicycle or a motor-bike. With motor-car one can travel comfortably for long distances. You can also travel by sea in big cruise liners or small ships and by air on board modern airliners. But a lot of people prefer using trains for long-distance journeys. The first thing we do when we want to go somewhere far away is buying a ticket at a booking office (though now you can do it using a ticket-machine or even through the Internet).

Dialogue at a booking office

- Good afternoon. Can I help you?
- Hello, I'd like to book a ticket to Kiev.
- What date do you want to leave?
- On the 25th of November.
- Single or return?
- Single, please.
- Do you prefer lower or upper berth?
- Lower, please. I've always been afraid of falling down. How much is the ticket?
- It depends on the class of the car. What class would you like?
- Second, certainly. I am a student. By the way, do you have discounts for students?
- Sure, it's half the price of the ticket. So your charge is 60 hryvnyas.
- Here you are. And what time does the train start?
- It starts at 10.30 p.m. All the information you need is on your ticket: the date and time of departure, the car and place number, the charge and so on.
- Thanks a lot.
- Welcome. Have a nice journey.

The Benefits of a Cruise Holiday

O Active Vocabulary:

to be faced — стикатись; prospect — перспектива; quandary — скрутне становище; available — що ϵ в наявності; span — короткий відрізок часу; itinerary — маршрут; cabin — каюта; ashore — на березі; to dock — причалювати; arcade game — гральний автомат; to be likely — скоріш за все; like minded people — однодумці; to encourage — заохочувати; mingling — змішування.

В права 2. Знайдіть слова в тексті, що відповідають визначенням:

1) a period in which a break is taken from work or studies for rest, travel, or recreation; 2) a trip by sea in a liner for pleasure, usually calling at a number of ports; 3) a plan or line of travel; 4) a room used as an office or living quarters in a ship; 5) a short outward and return journey, esp. for relaxation, sightseeing, etc.; 6) a structure that has been built and filled with water for people to swim in; 7) a particular incident, feeling, etc., that a person has undergone.

More often than not, when you are faced with a prospect of planning a vacation, you find yourself in a quandary. A lot of options are available to you, whether these are railroad trips, vacations in hilly stations, beaches or trekking or even spending time at your parents'. Here, I am going to tell you what you will gain if you choose a cruise above all these. It offers you a big opportunity to go to a large number of places in a short span of time which you otherwise cannot visit. Often it depends on what the itinerary is and what cruise liner you choose.

The best thing is that a cruise package comes with food and it's especially good for people who tend to eat "more". In a cruise, you also need to get settled at one place only, in your cabin. You can go ashore to all places from here, and finally at the end of the day come back and rest here. There is no need to go and try to settle yourself at various hotels.

A lot of cruises also come with packages that plan your onshore activities, places you visit and your guides. Before you dock at a place, it tells you of the importance of the place you are going to visit, and the places recommended to visit. Once you are on the shore, there will be people present to guide you through the whole excursion. This tends to make your experience a pleasant and memorable one.

On board time also can be spent in a variety of wonderful ways. There will be different types of activities for people with a wide range of interests. It may be arcade games and libraries for the quiet, or pools and parks for the more active ones. There are also special 24-hour bars and clubs for young people and all day activity packages suitable for them. Golf, aerobics, theater, comedy, shopping – you get them all here.

Finally, you are likely to spend the time in your cruise with like minded people and you have a great opportunity to make lifelong friends. Most of the activities are tailored to let people come closer to each other and encourages "social mingling" among the people.

A cruise guarantees a great experience for you.

⊙ Smile!

From a passenger cruise ship, everyone can see a bearded man on a small island who is shouting and desperately waving his hands. "Who is it?" a passenger asks the captain. The cruise ship captain replied, "I've no idea. Every year when we pass, he goes nuts."

Going Through the Customs

Прочитайте та перекладіть текст.

Nowadays travelling abroad is very popular. <u>Some people prefer</u> travelling by plane, especially businessmen, because it is the fastest means of transportation. Those who <u>are not short of time</u> usually <u>travel by train</u> or by ship. <u>It takes more time</u> but gives the opportunity to see the country you travel through, its picturesque landscapes and nature.

While travelling abroad you have to go through the customs and passport control, sometimes several times. As a rule the passport control officers check your passports and visas if they are required. When coming to some countries you may need a health certificate or a certificate of vaccination. If you have got anything to declare, then you are to fill in the declaration form.

The customs officers may ask you to show your luggage to them. Usually personal belongings and used items and gifts are not <u>liable to duty</u> anywhere. If you are carrying much currency you should also declare it. If you are carrying weapons you need a permit. Although some items are liable to duty, if you carry only a small amount of them, they are <u>duty free</u>.

Occasionally the customs officers may take some of your things for a more detailed inspection. But usually they return them soon.

Do not try <u>to break the customs rules</u> and regulations because you may have a lot of troubles.

Вправа 1. Складіть діалоги з наведеними виразами.

Here is my passport (visa, health certificate, certificate of vaccination, declaration form). Have you got anything to declare? Is there anything liable to duty? I have got nothing to declare. There is nothing liable to duty. Are these things liable to duty? These things are duty free. Are you carrying any currency? I have only some used things and gifts. I have only my personal belongings.

9.3. Письмові завдання

Вправа 2. Перекладіть речення англійською письмово.

telephone directory — телефонний довідник; receiver — телефонна трубка; buzz — гудіти; dial — диск телефону, набирати номер; engaged — зайнятий; to hold the wire (line) — бути на лінії; interrupt — переривати; avoid — запобігати.

The Procedure of Telephoning

Telephoning is very simple. You look up the necessary number in the telephone directory; then you pick up the receiver and wait for the signal (buzz, buzzing sound). Next you make the necessary turns of the dial, according to the number required, and you will know at once whether the line is clear or engaged (*Am*. busy) from the buzz given automatically.

If you hear a prolonged buzzing, hold the wire and your number will answer in a moment. A frequent high tone buzzing means that the line is engaged. In this case you must put down or hang up the receiver and wait for a couple of minutes.

If you wish to interrupt a conversation for a couple of minutes, you say, "Please hold the line", and put the receiver on the desk. In this way you avoid being cut off (disconnected). Having finished speaking you put the receiver on its rest.

Дайте відповіді на запитання.

1. What do you do when you want to telephone? 2. What do a prolonged buzzing and a frequent high tone buzzing mean? 3. What do you do when you wish to interrupt a conversation?

Interesting Facts about Telephones

- Valdemar Poulsen, the Danish telephone engineer and inventor, patented what he called a "telegraphone" in 1898. The telegraphone was the first practical apparatus for magnetic sound recording and reproduction, and enabled telephone conversations to be recorded. This was followed by Willy Müller who invented the automatic answering machine in 1935.
- Alexander Graham Bell suggested the word "ahoy" for telephone greeting (as used in ships), but it was later superseded by Thomas Edison, who suggested "hello" instead.
- The very first phone call was "Watson come here, I want you!". It was made on March, 10, 1876 in Boston, Massachusetts, between Alexander Graham Bell and his assistant Thomas A. Watson.
- The first transatlantic telephone cable was used in 1956. A telephone cable was run across the ocean floor and lies as deep as 12,000 feet. The cable runs across the Atlantic Ocean from Canada to Scotland.

Some Tips on Staying at a Hotel

When travelling, people almost always stay at hotels. It is advisable, therefore, to remember the following:

- 1. The first thing to do is to book a room in advance either by letter, telephone, fax or Internet. Otherwise you may arrive at the hotel and be told that it is full.
- 2. On arrival at the hotel go to the reception desk in the lobby and confirm your reservation. The clerk will then give you a registration form to fill in and sign (the form is filled in block letters). In smaller hotels you simply sign the visitor's book and give your permanent address.
- 3. In large hotels you may ask for any service by telephone. You tell the operator if you wish to be called at a certain time. You call room service when you want a meal or drinks sent up to your room, and you can have a lot of maid service if you need something (a suit or dress) cleaned or pressed.
- 4. Let the hotel management know well in advance the day and time of your departure.

Дайте відповіді на запитання.

1. What are the ways to reserve a room at a hotel? 2. What do you do first of all when you arrive at a hotel? 3. Do you need to have your passport with you when you check in at a hotel? 4. What does the receptionist do in a hotel? 5. What kind of service may you ask for by telephone in large hotels?

Lesson 12. Cross-cultural Communication 12.1. Розмовна тема. Традиції та звички іноземців Customs and Traditions around the World

O Active Vocabulary:

custom – традиція; queue – черга; appointment – призначена зустріч; chopstick – паличка; toe – палець ноги; social insult – соціальна образа.

England

The first thing you should remember when in England is always to say "please" and "thank you". Never push into a queue of people or they will get angry. Don't be late for appointments and don't talk with your mouth full. Remember – always ask before smoking in someone's house.

China

When in China, don't kiss anyone in public – it's very rude. Never be late for appointments, and don't tell jokes to people you don't know very well. Be careful when you are eating, too – never leave your chopsticks pointing upwards in your rice because this makes people very upset. A last tip – when you give someone a present, give it with both hands.

Japan

When you visit someone in Japan, it is polite to take a gift. Remember to take your shoes off as you enter the house – hosts will give you special slippers to wear instead. Leave your shoes at the door, but make sure the toes are pointing towards the door. When you are in the living-room, don't sit anywhere you like – wait until someone shows you where to sit. Also, don't blow your nose in public – find a place where you can do it alone. Showing the soles of your feet is

the height of bad manners. So, never put your feet on the desk as the Americans like to do. It is a social insult for Japanese people.

What advice can you give to visitors of England, China, and Japan? Give at least three pieces of advice for each country using the structure: When in ..., you should (shouldn't) ...

Gestures in Different Cultures

Nowadays people enjoy travelling throughout the globe getting to its farthest corners. It often happens that they are unfamiliar with the language of the country they are visiting. And then hand-language may appear rather helpful. But you should be aware that hand gestures in different cultures may imply different meanings. It is very important to understand the meaning of different gestures, if you happen to visit a new country.

Peace Sign

The peace sign, or victory symbol, is created when an individual balls up his hand, extending the index and middle fingers to form a V. The sign is usually shown with the palm facing outward. This sign was made famous by Winston Churchill during World War II, when he used it to signify victory. Americans in the 1960s used it to signify peace. If a European uses the sign, but turns the palm to face inward, the gesture becomes vulgar.

Signaling Okay

Place the thumb and the index finger in an "O" shape, and extend the rest of the fingers into the air. The resulting gesture means "Okay" or signifies approval in the United States. In Japan, however, it signifies money, and in Brazil or Germany, it's downright rude. Nod head up and down to say "Yes." In Bulgaria and Greece, this gesture means "No."

Thumbs Up

The thumbs-up sign is simply a balled fist with the thumb extended into the air. Americans and Europeans use this gesture as a sign of approval. They also use this gesture to try to get a ride in a passing vehicle. Other cultures, however, find the sign insulting.

Pointing Finger

A pointed finger has mixed messages for many cultures, even Americans. When the hand is balled into a fist with the index finger extended, the gesture may be used to indicate an item at a distance. If the finger is pointed at a person, it is seen as accusatory for some Americans and for Middle or Far East cultures. Other cultures consider the person gesturing to be attempting dominance over the recipient of the gesture.

Crossing your Fingers

Many western cultures make this gesture when wishing for good luck. A hand with the index and middle fingers crossed is even the logo for the UK's National Lottery. In Vietnam, however, this is an obscene gesture.

Вправа 2. Визначте, чи є вірними такі висловлювання.

1. In Greece, nodding your head means "come here". 2. Winston Churchill used the V-sign to signify peace. 3. If you are in America and want somebody to give you a lift, wave your hand to the driver. 4. Crossed index and middle fingers mean wishing good luck in Europe. 5. In Japan, "O"-shaped sign means "zero".

Here are some final tips for travellers

- In France you shouldn't sit down in a cafe until you've shaken hands with everyone you know.
 - In Afghanistan you should spend at least five minutes saying hello.
 - In Pakistan you mustn't wink. It is offensive.
- In the Middle East you must never use the left hand for greeting, eating, drinking, or smoking. Also, you should take care not to admire anything in your hosts' home. They will feel that they have to give it to you.
- In Russia you must match your hosts drink for drink or they will think you are unfriendly.
- In Thailand you should clasp your hands together and lower your head and your eyes when you greet someone.
- In America you should eat your hamburger with both hands and as quickly as possible. You shouldn't try to have a conversation until it is eaten.

Lesson 13. Ukraine

13.1. Розмовна тема. Україна

① Active Vocabulary:

government – уряд; anthem – гімн; to border on – межувати 3; total area – загальна площа; mountain – гора; tributary – приток; moderate – помірний; fertile – родючий; black soil – чорнозем, agricultural – сільсько-господарський; to be rich in – бути багатим; equipment – устаткування; instrument – прилад; consumer goods – споживчі товари; legislative – законодавчий; executive – виконавчий; judicial – судовий; to be elected – бути обраним.

Ukraine is situated in the south-eastern part of Central Europe and has its own territory, government, national emblem, flag and anthem. It borders on Russia, Byelorus, Moldova, Slovakia, Romania, Hungary and Poland on land and Russia and Romania on sea. The population of Ukraine is about 47 million. The total area of the country is 603,700 km² (45th country in size). The capital of Ukraine is Kyiv.

The territory of Ukraine is mostly a level, treeless plain, called "steppe". There are the Crimean Mountains in the Crimean peninsula and the Carpathians in the west, but they are not very high. The territory of our country has an astonishing variety of landscapes. We have high mountains, vast steppes, endless forests, beautiful rivers and lakes. The largest lake of Ukraine is Swytyaz, its total area is 24.2 square kilometres and the depth is 58.5 metres. Ukraine has 131 rivers, among them are the Dnieper with its tributaries such as the Desna, the Pryp-

yat, the Dniester, the Bug, the Donets. The flora and fauna of our country are extremely rich. Almost all kinds of European animals and birds can be found on the territory of our vast land. Ukraine has inexhaustible natural wealth. It possesses enormous tracts of woodland, vast tracts of fertile arable lands and fine pastures.

The climate of the country is moderate. Winter is rather mild, with no severe frosts but with regular snowfalls everywhere except the south. The rivers and lakes freeze in winter. The average winter temperature varies from -20 Centigrade in the north to -5 in the south. Summer is quite hot and dry, with occasional showers and thunderstorms. The fertile black soil is well watered in spring and autumn and gets plenty of sunshine in summer.

The country is rich in natural resources, such as iron ore, coal, colour metals, oil, gas, mineral salts, clay and potential water power. It has developed a varied industry, concentrated mostly in and around such big cities as Kyiv, Zaporizhzhya, Dnipropetrovsk, Dniprodzerzhynsk, Odesa, Kharkiv, Lviv, Myckolayiv and others. It produces planes and ships, lorries and busses, motorcars and locomotives, computer and electronic equipment, precision instruments and agricultural machines, TV and radio sets, chemicals and textiles and various consumer goods. Odesa, Sevastopol, Myckolayiv, Kherson and Kerch are main Ukrainian ports.

Due to the favorable climatic conditions, Ukraine is traditionally an agricultural area. It grows wheat, maize, buckwheat and other corn, red and green vegetables, all kinds of fruit, melons and berries. Ukraine is one of the world's main centers of sugar production. It produces sugar both for its own needs and for export.

Ukraine is a presidential-parliamentary democracy with separate legislative, executive, and judicial branches. The Declaration of Ukrainian Independence was proclaimed on August 24, 1991 by the Ukrainian Parliament. The President of Ukraine is elected by countrywide popular vote and is the head of the executive branch. The Prime Minister is appointed by the 450-seat parliament, the Verkhovna Rada. The parliament also approves the Cabinet of Ministers, offered by the Prime Minister and the President. The heads of all central agencies and regional and district administrations are appointed by the President.

Ukraine is subdivided into twenty-four oblasts (provinces) and one autonomous republic, the Crimea. Additionally, two cities, Kiev and Sebastopol, have a special legal status.

Ukraine has its own original culture and art. Ukraine has many professional theatres and Philharmonic societies. The National Symphony Orchestra of Ukraine, the Gryhory Veryovka Ukrainian People's Choir, the Dance Company of Ukraine are known not only in the country but all over the world.

Five Subatomic Particles in a Nutshell

Ancient Greeks philosopher Leucippus and his pupil Democritus first spoke out the idea that all substances consisted of invisible "atomos," or atoms, as we know them today. They believed these atomos could be divided into smaller and smaller particles until they reached a point that they could no longer be divided. Although they couldn't see the particles, Leucippus and Democritus tapped into a fundamental truth about our existence: The universe is made up of atoms and these atoms are responsible for life on Earth.

After considerable research and experiments, we now know that atoms can be divided into subatomic particles – protons, neutrons and electrons. Held together by electromagnetic force, these are the building blocks of all matters. Advances in technology, namely particle accelerators, also known as atom smashers, have enabled scientists to break subatomic particles down to even smaller pieces, some in existence for mere seconds. Subatomic particles have two classifications – elementary and composite. Luckily for us, the names of categories can go a long way in helping us understand their structure. Elementary subatomic particles, like quarks, cannot be divided into simpler particles. Composite subatomic particles, like hadrons, can. All subatomic particles share a fundamental property: They have "intrinsic angular momentum", or spin. It means they rotate in one direction, just like a planet. Oddly enough, this fundamental property is present even when the particle isn't moving. It's this spin that makes all the difference.

Виберіть правильний варіант.

- 1. Leucippus and Democritus who first suggested the idea of atoms were ____ philosophers.
- a) Greek b) Roman c) German
- 2. The atom consists of three main subatomic particles: ____.

Lesson 14. Education in Ukraine 14.1. Розмовна тема. Освіта в Україні

① Active Vocabulary:

Pre-school education; compulsory education; fee-paying education; obligatory subjects; slant; optional courses; gymnasium; lyceum; extra-curricular activities; vocational training school; postgraduate education; applicant.

Present day independent Ukraine has a well-developed system of education which matches the standards of the developed countries. Pre-school education is not compulsory and is fee-paying. Most parents take their children to nursery schools or kindergartens at the age of 3. Up to the age of 5 children mostly eat, sleep and play there, but in senior groups they are taught the basics of arithmetic, reading, writing, and arts and foreign languages in some schools.

Compulsory secondary education begins at the age of 6–7 and is free in state schools and fee-paying in private ones. Some schools, especially those with language slant, have preparatory classes. Secondary education includes three stages: primary ($1^{st} - 4^{th}$ grades), basic ($5^{th} - 9^{th}$ grades) and senior ($10^{th} - 11^{th}$ grades). Recently new types of schools have appeared: gymnasiums and lyceums. In addition, there are schools with advanced learning of sciences, computers, law, and art. All the subjects in the secondary schools are obligatory but there are optional courses that students of senior grades can take in addition to the required ones.

Extra-curricular activities usually include a variety of sports and drama clubs, interest groups and various school parties.

Those senior students, who want to get qualification alongside the secondary education, can go to vocational training school. Post-secondary education is provided by technical schools and colleges that train young specialists in different trades.

Institutions of higher learning (higher educational establishments) include universities, academies, institutes and conservatories. To enter a higher educatuional institution all applicants have to pass special tests in various subjects. Shevchenko Kyiv National University, Kyiv National Technical University, Karazin National University, National Technical University "KhPI" and many others are among the best known higher educational establishments.

Postgraduate education begins after the last year of studies and usually results in a thesis on the chosen scientific theme and the degree of Candidate of Sciences. Doctor's Degree is awarded for outstanding scientific research.

What are the Smallest Particles We Know about?

For many years, the only known subatomic particles were protons, neutrons and electrons. By the 1960s, however, advancements in particle accelerator technology had shown evidence of hundreds of smaller constituent particles. These particles fall into several main categories.

Fermions are the building-block particles. There are two types of material fermions: quarks, which work to hold the nucleus of an atom together, and leptons, which do not.

Hadrons are composite particles made of smaller particles. A proton, for example, is a hadron made from a combination of different quarks.

Bosons are subatomic particles that carry force.

14.4. Граматика. Пасивний стан дієслова груп Indefinite Пасивний стан (Passive Voice)

Стан – це категорія дієслова, яка демонструє відношення дії до суб'єкта чи об'єкта дії.

Пасивний стан показує, що дія направлена на предмет або особу, які є підметом (статтю перекладено, дім будується).

Наприклад:

Popov invented the radio. – активний стан (Active Voice) – Попов винайшов радіо.

The radio was invented by Popov. – пасивний стан (Passive Voice) – Радіо було винайдено Поповим.

Пасивний стан — це складна аналітична форма, яка утворюється за допомогою допоміжного дієслова *to be* у відповідному часі, особі та числі та дієприкметника минулого часу (Participle II):

to be + Participle II

О Запам'ятайте! Вживання часів пасивного стану відбувається за такими ж правилами, як і часів активного стану.

Приклади речень у Passive Voice

Стверджувальна форма

Is the letter being written (now)?

Was the letter being written (at 5 o'clock yesterday)?

Has the letter been written (already)?

Had the letter **been** written (by 5 o'clock yesterday)?

Will the letter have been written (by 5 o'clock tomorrow)?

Заперечна форма

Заперечна частка *not* ставиться після першого допоміжного дієслова.

The letter is not written (every day).

The letter was not written (yesterday).

The letter **will** not **be** written (tomorrow).

The letter is not being written (now).

The letter was not being written (at 5 o'clock yesterday).

The letter has not been written (already).

The letter had not been written (by 5 o'clock yesterday).

The letter will not have been written (by 5 o'clock tomorrow).

О Запам'ятайте! У пасивному стані **лише допоміжне дієслово** змінюється за часом.

Див. таблицю часових форм дієслів у пасивному стані в додатку 3 (**Appendix III**).

Lesson 15. Our Alma Mater

15.1. Розмовна тема. Наш університет National Technical University "KhPI"

Active Vocabulary:

respectively – відповідно; outstanding scientist – видатний вчений; to admit – приймати; Academic Council – вчена рада; employee – робітник; design – проектування; to contribute – робити внесок; to appoint – призначати; position – посада; to grant – надавати; recognition – визнання; contribution – внесок; development – розвиток; extramural department – заочне відділення; alumnus (pl. alumni) – випускник; thin film – тонка плівка; strength of materials – опір матеріалів.

The history of National Technical University "KhPI" goes back to the year of 1885. It is that year when Kharkiv Institute of Technology, or KhIT (the original name of our University), was founded. The KhIT was the first technical higher educational institution in the south of the Russian Empire. When the Institute was opened it had only two faculties: mechanical and chemical and 125 students (85 at the mechanical and 40 students at the chemical faculties respectively). The founder and the first director of our Institute was Professor V.L. Kirpichov, an outstanding scientist in the field of mechanics.

By the beginning of the 20th century the students' body of the KhIT had already numbered 1,000 students and 250 students were admitted each year. A lot of outstanding scientists whose names are known all over the world worked in KhIT at that time. They were: A.M. Lyapunov, V.A. Steklov, N.N. Beketov, K.A. Zvorikin, N.D. Pilchikov and many others. The Institute also had close contacts with such great world known scientists as D.I. Mendeleyev and N.A. Zhukovsky who were elected Honorary Members of the Academic Council of our Institute in 1904 and in 1911 respectively.

In 1930 five independent higher educational institutions for mechanical engineering, electrical technology, chemical technology, engineering & construction and aviation were set up on the basis of five separate faculties of the institute.

During the years of the World War II over three thousand professors, students and employees of the institute joined the Army. Evacuated to the cities of Krasnoufimsk and Chirchiq, the institute not only continued training engineering staff, but also solved urgent scientific problems related to strengthening the defense of the country (such as contributing to the tank design work led by Alexander Morozov, one of the key experts in the development of T-34 tank).

In 1949 four higher educational establishments, namely the institutes for mechanical engineering, chemical technology, electrical technology and the institute of the cement industry reunited into the V.I. Lenin Kharkiv Polytechnic Institute. Professor Mikhail Semko was appointed its rector and stayed at this position for 30 years.

In April 1994 the Cabinet of Ministers of Ukraine granted Kharkiv Polytechnic Institute the university status, so it was renamed to Kharkiv State Polytechnic University (KhSPU).

On the 11th of September 2000 (two thousand) our Institute was given the name of National Technical University "Kharkiv Polytechnic Institute". The status of "National" is a recognition of our Institute contribution to the development of national higher education, science and economy.

NTU "KhPI" is one of the leading higher educational establishments of Ukraine. It is also one of the largest and oldest not only in our city but in our country as well. There are more than 20 departments training students for more than 90 specialities (at day-time and extramural departments). During its glorious history our Polytechnic has trained more than 130,000 specialists. Among them are such noted alumni and employees as Lev Landau, Soviet physicist, Nobel Prize winner (1962); Nikolay Beketov, Russian physical chemist; Mikhail Gurevich, Soviet aircraft designer; Anton Valter, Soviet nuclear physicist, one of the founders of the Ukrainian Institute of Physics and Technology and many others.

Scientific schools well-known all over Ukraine and the world are developed in the fields of physics of thin films, dynamics and strength of materials, cutting machinery, design and production of turbines etc.

Many University departments cooperate with foreign countries: Germany, Hungary, Austria, France and America in various fields of modern technology and business.

What's a Neutrino?

A neutrino, an elementary particle, whose existence was first suggested by physicist Wolfgang Pauli in 1930, is electrically neutral and can pass through ordinary substances intact, rarely interacting with other particles. Neutrinos are believed to have a very small mass or possibly no mass whatsoever.

Neutrinos are one of the fundamental particles which make up the universe. They are also one of the least understood. Neutrinos are similar to the more familiar electron, with one crucial difference: neutrinos do not carry electric charge. Because neutrinos are electrically neutral, they are not affected by the electromagnetic forces which act on electrons. Neutrinos are affected only by a "weak" sub-atomic force of much shorter range than electromagnetism, and are therefore able to pass through great distances in matter without being affected by it. If neutrinos have mass, they also interact gravitationally with other massive particles, but gravity is by far the weakest of the four known forces.

Three types of neutrinos are known; there is strong evidence that no additional neutrinos exist, unless their properties are unexpectedly very different from the known types. Each type of neutrino is related to a charged particle (which gives the corresponding neutrino its name). Hence, the "electron neutrino" is associated with the electron, and two other neutrinos are associated with heavier versions of the electron called the muon and the tau (elementary particles are frequently labelled with Greek letters, to confuse the layman).

15.4. Граматика. Особливості вживання пасивного стану

Речення у пасивному стані в англійській мові вживаються значно частіше, ніж в українській. Підметом речення в пасивному стані може бути прямий, непрямий, а також прийменниковий додаток.

Реченню в активному стані з **двома додатками** відповідають 2 речення в пасивному стані, наприклад:

The teacher showed *us* the new book. – We were shown the new book.

The new book was shown to us.

При перетворенні в пасивний стан речення з прийменниковим додатком прийменник залишається на своєму місці – після дієслова:

Everybody was looking at him. – He was being looked at by everybody.

Вправа 5. Перепишіть речення в пасивному стані у 2-х варіантах.

1. They showed him the way to the station. 2. Mother told her the news when she returned home. 3. The company offers us the goods at low prices. 4. The chief has given the workers the detailed instructions. 5. They promised him immediate help. 6. The friends presented her a new smartphone. 7. You will send me all the necessary data. 8. They have given him 2 hours to make his decision. 9. We paid the lawyers \$200 for their job. 10. He made her a proposition yesterday.

Вправа 6. Перепишіть речення у пасивному стані.

1. We use these clothes only on special occasions. 2. He published the book last year. 3. Somebody has opened the door and turned on the light. 4. They will answer you in some days. 5. Who wrote this novel? 6. They showed her the easiest

way to do it. 7. We have looked for the wallet everywhere. 8. Nobody has visited him. 9. They will have finished the work by twelve. 10. The students are taking the exams now. 11. The nurse is looking after the children.

Вправа 7. Перекладіть речення. Визначте час та стан присудка у кожному реченні.

1. The Nobel Prize was awarded to British scientists for this outstanding discovery. 2. Lasers have been used by communication and building workers, drillers etc. They are also designed to help doctors and scientists in their research. 3. Experts believe that by the end of the decade lasers will have been used in more spheres. 4. When computers were designed they found wide application in industry. 5. Polypropylene resins are being used in films, tubes and hundreds of other industrial articles. 6. Polymers are machined much easier than wood, stone or metal, therefore so much attention is being paid to these man-made materials at present. 7. The construction of the road was being completed when the chief arrived.

15.6. Домашне завдання

Вправа 8. Поставте присудок у реченнях в усі форми пасивного стану. Виберіть необхідний індикатор часу: always, often, in 2001, yesterday, at five o'clock tomorrow, in a week, today, by the end of the month, when I came in, by the time of our arrival, at the moment, during the break, just.

1. The articles are translated by Peter. 2. The devices are constructed by our engineers.

Вправа 9. Перепишіть речення у пасивнму станні в 2-х варіантах.

1. The scientists are explaining us the situation on the steel market. 2. He will prove them the possibility of using these materials. 3. The reporter showed the audience the charts and diagrams. 4. She gives me a nice example of creative work. 5. The parents have sent him some money.

Вправа 10. Складіть розповідь про свій вищий навчальний заклад з використанням активних слів та виразів.

Вправа 1. Доповніть текст даними про ваш факультет.

The department of ___ was founded in ___.

It trains specialists for ___ industry.

It closely cooperates with industrial enterprises such as ___.

Besides training specialists our department conducts research and scientific work.

Many well-known scientists such as ___ worked at our department.

At present time the department trains specialists in ___ specialities. These specialities are: ___.

Graduates of our department work at ___.

What Does the Large Hadron Collider Do?

The Large Hadron Collider (LHC) is currently being installed in a 27-kilometer ring buried deep below the countryside on the outskirts of Geneva, Switzerland. It started its operation in 2007, and became the world's most powerful particle accelerator. During the experiments, high-energy protons in two counter-rotating beams are smashed together in a search for signatures of supersymmetry, dark matter and the origins of mass.

The beams are made up of bunches containing billions of protons. Traveling at a whisker below the speed of light they are injected, accelerated, and kept circulating for hours, guided by thousands of powerful superconducting magnets.

The experiments' detectors will watch carefully as the energy of colliding protons transforms into thousands of exotic particles. The detectors could see up to 600 million collision events per second, with the experiments trying to obtain the data for signs of extremely rare events such as the creation of the much-sought Higgs boson.

Виберіть правильний варіант.

- 1. The Large Hadron Collider is a powerful .
- a) laser b) particle accelerator c) atomic power plant
- 2. The LHC is built in .
- a) Switzerland b) France c) America
- 3. During the experiments, the beams of high energy ____ collide.
- a) molecules b) protons c) electrons
- 4. The scientists try to observe the creation of ____.
- a) Dirac's positron b) Rutherford's atom c) Higgs boson

16.4. Граматика. Особливості перекладу пасивних конструкцій

В англійській мові пасивний стан вживається частіше, ніж в українській. Існує декілька випадків, коли переклад присудка у пасивному стані становить певні труднощі.

1. Якщо у пасивному стані є носій дії (**by somebody**), то при перекладі можна вживати особову форму дієслова в активному стані:

The news is brougt by my sister. – Новину принесла моя сестра.

2. Якщо присудок у пасивній конструкції виражений дієсловом з прийменником, то підмет перекладають додатком з відповідним прийменникком, а присудок – неозначено—особовою формою дієслова.

The doctor was sent for. – Послали за лікарем.

The child is being looked after. – За дитиною доглядають.

О Запам'ятайте дієслова з прийменником!

to look for – шукати	to wait for – чекати
to look through – переглядати	to pay attention to – звертати увагу на
to work on – працювати над	to listen to – слухати
to refer to – посилатися на	to rely on – покладатися на

3. Безособові конструкції перекладають наступним чином:

It is known that – Відомо, що	It is expected that – Чекають, що
It is said that – Говорять, що	It should be mentioned that – Слід зга-
	дати, що

В права 3. Перекладіть речення. Зверніть увагу на дієслова, які потребують після себе прийменника.

1. He was listened to with great attention. 2. The child was looked for everywhere. 3. The documents were sent for a week ago. 4. Her children will be taken care of. 5. She is always waited for. 6. Tsiolkovsky's works are often referred to at present. 7. He doesn't like to be laughed at. 8. The results of the last experiment were constantly referred to by the professor.

Вправа 4. Поставте дієслово в дужках у необхідному часі.

1. The inventor of the radio, Popov, (to bear) in 1859. 2. The work (to do) by students at the laboratory. 3. The mother (to tell) not to worry about her sick boy. 4. He (to examine) soon by the doctor. 5. The cat (to call) Pussy, but my little sister (to call) it Push. 6. Great progress (to make) in radio engineering since that time. 7. The first two-electrode valve (to make) in 1904. 8. Great progress (to achieve) in the field of electronics. 9. I (to give) a kitten last week.

Вправа 5. Розкрийте дужки та поставте дієслова у Passive Voice.

1. Soon he (to send) to a sanatorium. 2. The book (to discuss) at the next conference. 3. The composition must (to hand) in on Wednesday. 4. Yesterday he (to tell) to prepare a speech. 5. The article (to publish) last week, if I am not mistaken. 6. The lectures (to attend) by all of us. 7. A taxi (to call) fifteen minutes ago, so we are expecting it any moment. 8. The young man (to introduce) to me only a couple of hours ago, but it seems to me that I've known him for years.

Вправа 6. Передайте речення у Passive Voice.

1. They broke the window last week. 2. When I came home, they had eaten the sweets. 3. We will do the work in the evening. 4. He wrote this book in the 19th century. 5. They were playing tennis from four till five. 6. They have made a number of important experiments in this laboratory. 7. Livingstone explored Central Africa in the 19th century. 8. By the middle of autumn we had planted all the trees in the orchard. 9. They will stage this play at the beginning of the next season. 10. They have forgotten the story.

Вправа 7. Перекладіть речення англійською.

1. Вже послали за ліками? — Так, їх зараз шукають. 2. Його виховала сестра. 3. Не турбуйся, йому допоможуть в роботі. 4. Нажаль, в нашому районі вирубують багато дерев. 5. Цей міст ще будується. Він вже будувався, коли я побачив його вперше. 6. Коли файл копіювався, раптом виключили електрику. 7. Коли я прийду додому, обід ще буде готуватись. 8. Це явище широко обговорювалось у науковій пресі.

16.5. Домашне завдання

Вправа 8. Трансформуйте речення з активного у пасивний стан. Перекладіть речення.

1. They deliver all the mail at half past nine. 2. This engineer is writing the letter in English. 3. William taught this group of children. 4. The students will buy the theatre tickets next week. 5. They have published this booklet. 6. They had built this block of flats by the end of the year. 7. Mary was writing the article for the journal from five till eight. 8. Everybody knows you. 9. Everyone hears our broadcasts. 10. We will have finished the work by Saturday.

В права 9. Назвіть номери речень, присудок яких стоїть у пасивному стані.

1. May 7, 1895 has entered the history of science as the date of the invention of radio. 2. In 1938 the first TV station came into being in Moscow, but the war stopped the development of television. 3. The international exchange programmes will be developed still further in future. 4. Some powerful radio stations have recently been built in the northern regions. 5. Much attention is being paid to the development of three-dimensional television.

Lesson 17. My Major

17.1. Розмовна тема. Моя спеціалізація

В права 1. Прочитайте розмовні формули для розповіді про будь-яку спеціальність та складіть розповідь про власну спеціальність.

am a first year student of NTU "KhPI".
I study at Department.
I major in
Besides my speciality at our department there are such specialities as
In I will gain a Bachelor's Degree.
After graduating from the University I am going to be an engineer (technologist
designer, etc.) and work in (at)

17.2. Письмове завдання

Вправа 2. Заповніть пропуски словами зі списку: what, courses, it's, you, does, include, little, to highlight, to, field, school, because, for, fascinates.

There are two reasons to choose a major: to prepare for a specific ____ or job, or to immerse yourself in a subject that ____ you.

Some students choose a major because it will prepare them for a specific
career path. Career-focused majors engineering, business, or education.
Other students choose a major simply they love the subject. If you choose
this path, you may pursue a career that has to do with what you studied in
college. Here are some ideas on how to start your search the right major.
Forget high College is a whole new ball game. Subjects you hated as a
high school student might turn out to be completely different in a new edu-
cational setting. Make the most of the general education you're required to
take. Don't just pick whatever's easiest; choose ones that appeal to, even if
they are upper-level courses. You don't yet know what will really compel you.
Talk to your advisors. They know what it takes to tackle certain academic
disciplines. Tell them your strengths and your interests. They'll be able
courses that might excite you as well as classes that are popular with other stu-
dents.
Check the syllabus. What are the assignments? The books? The require-
ments? Does the material seem compelling to you? If you start nodding off
while reading the course catalogue, perhaps best to cross that field off your
list.
Ask upperclassmen. They are the real experts at your college, and they have
faced the daunting task of declaring a major themselves.
Engage professionals in fields you find interesting. Ask them exactly
their jobs entail and how their careers do (or don't) relate to their majors.
But the main thing to remember is that your major not determine your
life. You should choose a subject that interests you and that has some connection
to the post-collegiate life you want to build for yourself. But keep the decision in
perspective; you can always change careers or go back school.

What is Classical Physics?

Classical physics is a branch of physics in which matter and energy are two separate concepts. Based primarily on Sir Isaac Newton's laws of motion and James Clerk Maxwell's theory of electromagnetic radiation, classical physics is generally divided into several different areas. These areas include mechanics, dynamics, hydrodynamics, statics, optics, thermodynamics and acoustics, as well as the study of magnetism and electricity. The laws of conservation of mass, conservation of energy and conservation of momentum are also very important to classical physics. They state that mass and energy can be neither created nor destroyed, and the momentum of an object will only be changed if an outside force acts on it.

Виберіть правильний варіант.

- 1. Classical physics deals with matter and energy as ...
- a) two separate concepts b) a single notion c) the only things worth studying
- 2. The "parents" of classical physics are Newton and ____.
- a) Faraday b) Einstein c) Maxwell
- 3. Classical physics also studies the law of ____.
- a) transition from quantity to quality b) conservation of energy c) supply and demand

Lesson 18. The City of Science and Education 18.1. Розмовна тема. Місто науки та освіти

① Active Vocabulary:

crossroads – перехрестя; route – шлях; civil engineering – громадянське будівництво; jet aircraft – реактивний літак; control system – система керування; carrier rocket – ракета-носій; vehicle – транспортний засіб; to constitute – становити; core – ядро; solid-state physics – фізика твердого тіла, labour pool – трудовий резерв.

Industry, Science and Education in Kharkov

The city of Kharkiv was founded over 350 years ago at the crossroads of major transportation routes. It has now become one of Ukraine's largest centres for science, industry and culture.

There are about 250 large industrial enterprises in the city, the most important of which are in mechanical engineering and metal working, electrical power engineering and construction materials industries. The chemical, printing and woodworking industries are also well developed, and the city has a highly developed civil engineering industry.

The products of Kharkiv companies are well known in Ukraine and abroad. They include tractors and turbines, jet aircrafts, automated machine tools, electrical motors and engines for agricultural machinery, TV sets and electrical devices, medical equipment and pharmaceuticals.

Specialists from Kharkiv have contributed greatly to rocket engineering and space exploration. Control systems for carrier rockets and space vehicles, as well as several generations of rocket systems, have been developed by research and engineering specialists from Kharkiv. These systems constitute the core of the CIS space program.

The research and development potential of the city is represented by its research and design institutes and design offices. Kharkiv is the largest regional centre for the Ukrainian Academy of Sciences, and over 150 institutions in Kharkov deal with science and research work.

Fundamental research schools and universities in Kharkiv are leaders in the country. Investigations by Kharkiv scientists in the fields of solid-state physics, cryobiology and cryomedicine, radio electronics, crystal synthesis, low temperature physics, genetics and selection are known worldwide.

Specialists in various fields of knowledge are trained in Kharkiv state institutions including 6 academies, 10 universities and 8 institutes. Institutions such as Kharkiv National University, NTU "KhPI", State Law Academy, Engineering and Pedagogic Academy, and Pharmaceutical Academy are well known and respected. There is also a growing number of private educational institutions.

The high educational level of the population is a major factor of the city's progress.

The city has 193 elementary, middle and high schools, 8 college preparatory high schools, 37 vocational schools and 4 junior colleges. The students of these schools provide a highly qualified labour pool for business enterprises and institutions.

Дайте відповіді на запитання.

1. When was Kharkiv founded? 2. Is Kharkiv the largest Ukrainian industrial centre? 3. How many industrial enterprises are there in Kharkiv? 4. What industries are presented in Kharkiv? 5. What products do Kharkiv enterprises manufacture? 6. What is Kharkiv's contribution to the space exploration? 7. How many institutions in Kharkiv deal with science and research work? 8. What fields of science are the most developed in Kharkiv? 9. How many and which state institutions of higher education are there in Kharkiv?

What is Fiber Optics?

Fiber optic technology allows humans to control the path of a beam of light by confining it within ductile, transparent materials, like cords of plastic and glass. These transparent materials function as pipelines for light, and with their help, light, which usually moves in straight lines, can be sent along curved trajectories or around corners. Optical fibers of very pure glass have a surprisingly massive range, having been observed to carry light across distances greater than 100 miles (160 km) with only slight dimming. Some individual fibers measure less than 0.00015 inches (0.004 mm) wide, which makes them thinner than human hair. The light transmitted by optical fibers can be used for simple illumination, or to transmit signals and data. Though there was some practical application of fiber optic technology as early as the 1950s, major commercial implementation began in the 1980s.

Виберіть правильний варіант.

- 1. In fiber optic technology, such materials as ____ are used to transmit light.
- a) wood b) plastic c) metal
- 2. Optical fibers can carry light over the distances of ____.
- a) 1,000 km b) 100 km c) 10,000 km

- 3. The thickness of a single fiber is ...
- a) that of a match b) less than that of a human hair c) 3 inches
- 4. The commercial application of fiber optic began in the ____.
- a) 1950s b) 1980s c) 21st century

⊙ Time for Fun

• One day a professor was discussing a particularly complicated physics concept. A pre-med student rudely interrupted to ask, "Why do we have to learn this pointless information."

"To save lives," the professor responded quickly and continued the lecture.

A few minutes later, the same student spoke up again. "So how does physics save lives?" he persisted.

"It keeps the ignoramuses like you out of medical school," replied the professor.

- Two things are infinite: the universe and human stupidity; and I'm not sure about the universe. (Albert Einstein)
- French physicist Ampere (1775–1836) had two cats, one big and a one small, and he loved them very much. But when the door was closed cats couldn't enter or exit the room. So Ampere ordered two holes to be made in his door: one big for the big cat, and one small for the small cat.
- What's the difference between mechanical engineers and civil engineers? Mechanical engineers build weapons. Civil engineers build targets.

Lesson 19. Great Britain

19.1. Розмовна тема. Велика Британія

Прочитайте текст та знайдіть переклад підкреслених слів у словнику.

Great Britain, formally known as the United Kingdom of Great Britain and Northern Ireland, is situated on the British Isles. The British Isles consist of Great Britain, Ireland and some 5,500 smaller islands. The total area of the United Kingdom is 244,027 square kilometres. It is seventy-fifth in size among the countries of the world and it is less than two percent of the world's land area. The population of Great Britain is over 58 million people. About four fifths of the population is <u>urban</u>. The largest island in north-west Europe – Great Britain – is separated from Ireland by the Irish Sea and from the Continent by the English Channel (La Manche) and the Strait of Dover (Pas de Calais).

The <u>surface</u> of England and Ireland is rather flat. The highest mountain in the United Kingdom is Ben Nevis in Scotland (1343 m). There are many rivers in Great Britain but they are not very long. The rivers are deep and do not freeze in winter. The chief rivers are the Severn (220 miles) and the Thames (215 miles). Great Britain is known for its typically <u>maritime</u> climate with frequent rains, strong winds and continuous fogs.

Great Britain consists of four administrative parts: England, Wales, Scotland, and Northern Ireland. England is the heart of Britain. It is the richest, the most <u>fertile</u> and most populated in the country. The north and the west of England are mountainous, but all the rest of the territory is a vast plain. In Northwest

England, there are many beautiful lakes with green, wooded or grassy shores and grey mountains all around. It is called Lake District. The national symbol of England is red rose.

Wales is the smallest land of the United Kingdom. The capital of Wales is Cardiff, an important industrial centre and port. Most people in Wales live in the costal plains. The national symbol of Wales is a leek or a daffodil.

Scotland is a land of mountains, wild <u>moorlands</u>, narrow valleys, famous lakes and no end of large and small islands off the coast. The Highlands of Scotland are among the oldest mountains in the world. One-third of the people in Scotland live in or near its capital, Edinburgh, and its great industrial centre, Glasgow. The national symbol of Scotland is a thistle.

Northern Ireland was a part of Ireland as a whole before the early 20th century. The territory is small. It is a land of lakes, rivers and a varied sea coast. The capital city is Belfast. The national symbol of Ireland is shamrock.

Great Britain is a parliamentary monarchy. Queen Elizabeth II is the head of the state. In practice she <u>reigns</u> but does not rule. The country is governed in her name by the Government. Parliament is the supreme <u>legislative</u> body. It consists of two Houses: the House of Commons and the House of Lords. The Prime Minister is usually the head of the party which is in power.

The UK's flag is often called the Union Jack.

Great Britain is a highly developed industrial country. Shipbuilding is one of the principal industries of Great Britain. For centuries Britain has been the leading shipbuilder in the world.

Coal is the main source for the development of British industry. The biggest centres of iron and steel industries are situated in the <u>neighbourhood</u> of coal basins. They are Newcastle, Cardiff, Glasgow, and Sheffield. The district around Birmingham is a land of factories and mines. Coal-mining, metallurgy, textile, shipbuilding are the older branches of industry. The new industries are the chemical, electrotechnical, automobile, aviation, and electronics. The new industries have developed hand in hand with science and technology and are equipped to meet present technical demands. London, Liverpool and Glasgow are the biggest English ports. The products of Britain's economy, e.g. automobiles, textile, machinery, electronic equipment and many others, are exported to many countries of the world.

Agriculture is one of the largest and most important activities in Great Britain. The greater part of the land here is used for sheep-, <u>cattle-</u>, and <u>dairy farming</u>. Vegetables are grown in all parts of the country. The chief <u>grain crops</u> are wheat and barley.

Great Britain is a country of high culture. There are many universities, colleges and scientific institutes here. Such English scientists of the past as Newton, Faraday, Darwin, Rutherford and others greatly <u>contributed</u> to world science. English writers Shakespeare, Byron, Dickens, B. Shaw and many others <u>enriched</u> world literature.

Lesson 20. London

20.1. Розмовна тема. Лондон

① Active Vocabulary:

observation — спостереження; proximity — близькість; medieval — середньовічний; landmark — архітектурна пам'ятка; renowned — відомий; wealth — багатство; celebrated — славетний; pageantry — урочиста церемонія; fascinating — чарівний.

London is one of the world's greatest capital cities, with so much to see and do that Samuel Johnson's observation that "When a man is tired of London he is tired of life" is just as true today as it was 200 years ago.

London was founded in AD 60 by Romans soon after they invaded Britain and was called Londinium. Remains of the wall Romans built around the city can still be seen today. Ever since its foundation nearly 2,000 years ago, London has been the capital of Britain and, because of its location on the Thames and its close proximity to the continent, it has been an important trading centre. Today it is still a great financial centre, attracting important businesses from all over the world.

London's historic past can still be seen in its busy streets, from Roman walls, medieval churches and Tudor palaces to Georgian squares, Victorian railway stations and modern hi-tech office blocks. Landmarks such as Westminster Abbey, Buckingham Palace, St. Paul's Cathedral, the Tower of London and the Houses of Parliament are high on every visitor's list of places to see, but there is so much more to do.

London is renowned as a world-class cultural centre, with some of the finest museums and art galleries to be found anywhere in the world, including

the British Museum and the National Gallery. Londoners and visitors alike enjoy all that the West End has to offer, with its many fine shops, restaurants and clubs, as well as the wealth of plays and musicals offered by its many celebrated theatres.

Another huge draw is the traditional and colourful pageantry London is so good at, including the Changing the Guard ceremony and the Lord Mayor's Show, two of London's best free shows. But London is also a modern, forward-looking city, and many major new landmarks, such as the London Eye (a 137 meter observation wheel) and the Tate Modern (an exhibition centre of modern arts housed in a converted 1960s power station) take the capital well and truly into the twenty-first century. It is this mix of the traditional and modern which makes London such a fascinating and exciting place to visit.

Дайте відповіді на запитання.

1. How old is London? 2. Who founded London? 3. On what river does London stand? 4. What are the main historical landmarks to see in London? 5. In what part of London are most shops situated? 6. What is the London Eye? 7. In what building is the Tate Modern housed?

London Museums and Art Galleries

O Active Vocabulary:

a fortress – фортеця; a manuscript – рукопис; contemporary – сучасний; armour – лати; twofold – подвійний; garrison – гарнізон; custody – зберігання.

The best London museums and art galleries are in the West End.

The British Museum in Russel Square comprises the National Museum of Archeology and Ethnography, the richest collection of prints and drawings and the National Library. It was founded in 1753 and opened to the public on the 15th of January, 1759. The Library of the British Museum is one of the largest collections of books and manuscripts in the world.

The Natural History Museum in Cromwell Road is the home of the national collections of animals and plants, and of minerals and rocks from which the Earth is built up. It has a twofold function: to increase man's knowledge of the animal, plant and mineral Kingdom as an institution for scientific research, and to spread knowledge of natural history as widely as possible.

The Tower of London was once a fortress. Kings of England, when the battle turned against them, often found safety in the Tower. From Norman days the Tower had been a state prison; it had been a place of torture and execution. Continuously from the 11th century the Tower has held a military garrison. Arms and armour have always been stored there and today it contains the National Collection of them. Nowadays the Tower is a museum visited by tourists. As it was the strongest fortress in the land, the safe custody of the Crown jewels has been entrusted to it since the time of Henry III.

The National Gallery offers a wonderful variety of pictures. Everyone can find some kind of picture to enjoy. It was opened to the public in 1824 and in 1836 after series of troubles the collection of pictures of the National Gallery was established at Trafalgar Square.

The Tate Gallery from the very beginning was intended as a collection of contemporary British painting only. It became the national collection of British painting of all periods, and in addition – the national collection of modern foreign painting and of modern sculpture, both British and foreign.

The Science Museum exhibits machinery, scientific instruments and devices for research and educational purposes.

В права 2. Згадайте, в якому музеї знаходяться такі об'єкти:

- 1) the collection of the Crown jewels; 2) the collection of prints and drawings;
- 3) the collection of pictures; 4) the collection of books and manuscripts; 5) the collection of contemporary British painting; 6) the collection of animals, plants and minerals; 7) the collection of arms and armour; 8) the collection of machinery and scientific instruments.

Lesson 21. Education in Great Britain

21.1. Розмовна тема. Освіта у Великобританії

Прочитайте текст і знайдіть підкреслені слова у словнику.

Education in Great Britain has several stages. Three- and four-year-old children may start education in nursery schools and about 47% of underfives attend them. But this kind of education is voluntary. From 5 to 7 children go to infant school. At the age of 7 they move to junior school where they learn to write, to read, and to do mathematics. Boys and girls study at junior school for four years till they are 11. Then they enter the secondary school where they study up to 16. Education from 5 to 16 is compulsory.

There are two types of <u>secondary schools</u> in Great Britain: state schools, which are free of charge, and private schools, where parents pay <u>fee</u> for their children. They are called public schools and about 7% of students attend them. Most of public schools, like Eaton and Harrow, are single-sex boarding schools where students live during term-time.

The National Curriculum sets out in detail the subjects that children should study and the levels of achievement they should reach by the ages of 7, 11, 14 and 16. Under the National <u>Curriculum</u> schoolchildren must study English, Mathematics, Science (the core subjects), Technology, a foreign language, PT (physical training), History, Geography, Art, and Music. But the schoolchildren may choose the set of subjects to study according to their preferences: it may be either Arts or Science.

At the age of 16 all schoolchildren take their GCSE (General Certificate of Secondary Education) exams. After that the pupils have 4 main "roads" of their next life: they can leave the school, stay at school in so-called "sixth form", move to a college as a full-time student, and combine part-time study with a job. Those who choose to stay on at school after GCSE usually study for two further years for Advanced level (A-level) exams in two or three subjects. When the pupils are 18 they can enter the university, Polytechnics or college of higher education.

Universities in Great Britain

There are 46 universities in Britain. The oldest and best-known universities are <u>located</u> in Oxford, Cambridge, London, Manchester, Liverpool, Edinburgh, Bristol, and Birmingham. Oxford & Cambridge Universities date back from the 12th and 13th centuries. They are known all over the world and are the oldest and most prestigious universities in Britain. They are often called collectively Oxbridge, but both of them are completely <u>independent</u>.

Good A-level results in at least 2 subjects are necessary to get a place at a university. However, good exam passes alone are not enough. Universities <u>choose</u> their students after <u>interviews</u>.

After three or four years of study a <u>university graduate</u> will leave with the Degree of Bachelor of Arts, Science, Engineering, Medicine, etc. Later he may continue to take Master's Degree and then a Doctor's Degree.

There are about 30 Polytechnics in Great Britain. The Polytechnics, like the universities, <u>offer</u> first and higher degrees. Some of them offer <u>full-time</u> and <u>sandwich courses</u> (for working students).

Some school leavers at the age of 16 may go to a further education college where they can follow a course in typing, engineering, town planning, cooking, or <u>hairdressing</u>, full-time or part-time. Further education colleges have strong <u>ties</u> with commerce and industry.

There's an interesting form of studies which is called the Open University. It has a correspondence system and is particularly <u>designed for</u> adults who <u>missed the opportunity</u> to study earlier or who are interested in some particular subjects. The Open University is <u>free of charge</u>.

Lesson 22. The United States of America

22.1. Розмовна тема. Сполучені Штати Америки

Прочитайте текст і знайдіть підкреслені слова у словнику.

The United States of America popularly called "The States", "the USA", "The Land of <u>Liberty</u>" is one of the most <u>powerful</u> countries in the world. Since 1492, when Columbus discovered America, people from every country of the world have come to make their homes in America. Besides, the USA is often called "a nation of immigrants" because the country was <u>settled</u>, built, and developed by <u>generations</u> of immigrants and their children.

The United States of America is the fourth largest country in the world (after Russia, Canada and China). It occupies the southern part of North America and <u>stretches</u> from the Pacific to the Atlantic Ocean. It also includes Alaska in the north and Hawaii in the Pacific Ocean. The total area of the country is about 9.5 (nine and a half) million square kilometers. The USA borders on Canada in the north and on Mexico in the south. It also has a sea-border with Russia. The population of the country is more than 270 million.

The geography and the climate of the US is so <u>varied</u> that you can find there any landscape and weather. You can see <u>enormous</u> forests, snow-topped mountain peaks, gently <u>rolling meadows</u> with many streams, sea cliffs, wide grass savannas and even <u>deserts</u> there. The country can be nominally divided into three areas: Eastern area is a highland, central area is a plain and Western area is mountains including the Rocky Mountains, the Cordilleras and the Sierra Nevada.

There are five Great Lakes in the northern part of the USA. They are: Huron, Michigan, Superior, Ontario and Erie. The world-famous <u>water-fall</u> called Niagara Fall is situated there. There are a lot of rivers in the US. The Mississippi together with its tributary the Missouri is one of the longest rivers in the world.

The USA is among the greatest industrial nations. Large deposits of oil, coal, iron and other minerals are solid base for the development of American in-

dustry. The US produces about 25% of the world's industrial products, agricultural goods, and <u>services</u>. The US is the world's leader in many branches, <u>e.g.</u> biochemical and genetic engineering, aerospace <u>research</u>, communications, computer and information services, and similar high-tech fields. The USA is also the world's leading agricultural nation, which not only feeds her own people but exports the products abroad.

Washington, the capital of the USA, is situated in the District of Columbia (DC), named after Columbus, the discoverer of America. The city is named in honour of the first President George Washington who selected the <u>location</u> for the capital. Washington has been the capital of the USA since 1800.

The United States is a federal union of 50 states, each of which has its own government. The seat of the central (federal) government is the capital of the US – Washington, DC. This district is a piece of land which doesn't belong to any state. According to the US Constitution the power in the country is divided into 3 branches: the executive, headed by the President, the legislative, exercised by the Congress, and the judicial. The Congress consists of the Senate and the House of Representatives. The seat of the Congress is the Capitol. The US President is chosen by electors from each state and holds office for 4 years. Nowadays the President may be elected for two terms only. The President must be a U.S. citizen by birth, resident in the country for 14 years, and at least 35 years old. The presidential election is held every fourth year (leap year) on the first Tuesday in November. The official residence of the US President is the White House, where he works in the Oval Office.

The national banner of the United States of America, commonly known as "The Stars and Stripes" or "Old Glory", is a flag bearing 50 stars and 13 stripes. Each star represents a present-day state and each stripe stands for one of the 13 original colonies. The national symbol of the US is the eagle.

What Is the Big Deal about Quantum Theory?

Quantum theory is the theory that radiant energy is given off and absorbed in units, sort of like bullets from a gun, rather than a steady stream, like a water hose. It was originated by Max Planck, a German physicist, in 1900 through studies he made on radiant energy. Before his discovery, scientists thought that energy, like all other physical processes, was emitted and absorbed conti-

nuously. In 1905, Albert Einstein took it a step further and established quantum theory by showing that the energy of light is concentrated in particle-like quanta, rather than in a continuous wave. Today, physicists generally treat light as a wave in processes that involve its transmission, and as quanta, called photons, in processes involving emission or absorption. Quantum theory completely changed the study of physics and paved the way for discoveries about photoelectricity, photochemistry, and the structure and activities of atoms.

Lesson 23. Washington 23.1. Розмовна тема. Вашингтон

① Active Vocabulary:

separate – окремий; to be named in honor – бути названим на честь; to owe – завдячувати; except – окрім; representative – представник; sky-scraper – хмарочос; hollow – пустий; to enjoy – милуватися чимось; to be surrounded – бути оточеним; cherry-trees – вишневі дерева; slave – раб; on the other bank – на іншому березі; cemetery – кладовище.

Washington, the capital of the United States of America, is situated on the Potomac River in the District of Columbia. The district occupies the area of only ten square miles and does not belong to any separate state. It was named in honor of Columbus, the discoverer of America.

The capital owes much to the first President of the USA – George Washington. It was G. Washington, who chose the place for the District and laid in 1790 the cornerstone of the Capitol, where Congress sits.

Washington is not the largest city in the USA. It has a population of 900,000 people.

Washington has many historical places. The largest and tallest among the buildings is the Capitol with its great House of Representatives and the Senate chamber. There are no sky-scrapers in Washington because no other building must be taller than the Capitol.

The White House is the President's residence. All American presidents except George Washington (the White House was not yet built in his time) have lived in the White House. It was built in 1799. It is a two-storeyed white building.

Not far from the Capitol is the Washington Monument, which looks like a very big pencil. It rises 160 meters high and is hollow inside. A special lift brings visitors to the top in 70 seconds from where they can enjoy a wonderful view of the whole city.

The Jefferson Memorial was built in memory of the third President of the USA, Thomas Jefferson, who was also the author of the Declaration of Independence. The memorial is surrounded by cherry-trees.

The Lincoln Memorial is devoted to the memory of the 16th President of the US, the author of the Emancipation Proclamation, which gave freedom to Negro slaves in America.

On the other bank of the Potomac lies the Arlington National Cemetery where President Kennedy was buried. American soldiers and officers, who died in the World Wars I and II are buried there too.

Los Angeles

Los Angeles, Spanish for "The Angels", is the most <u>populous</u> city in California and the second largest in the United States, after New York City, with a population of 3.8 million, on a land area of 498.3 square miles (1,290.6 km²). It is the focal point of the larger Los Angeles – Long Beach Riverside – combined statistical area, which contains nearly 17.8 million people and which is one of the most populous metropolitan areas in the world and the second largest in the United States. Los Angeles is also the seat of Los Angeles <u>County</u>, the most populated and one of the most multicultural counties in the United States. The city's <u>inhabitants</u> are referred to as "Angelenos". Los Angeles was founded on September 4, 1781 by Spanish governor Felipe de Neve. It was incorporated as a municipality on April 4, 1850, five months before California achieved statehood.

Often known by its initials, *LA*, and <u>nicknamed</u> the *City of Angels*, Los Angeles is a world center of business, international <u>trade</u>, entertainment, culture, media, <u>fashion</u>, science, technology, and education. Los Angeles has been ranked the third richest city and fifth most powerful and influential city in the world, behind only New York City in the United States. As the home base of Hollywood, it is known as the "Entertainment Capital of the World", leading the world in the creation of <u>motion pictures</u>, television production, video games, and recorded music. The importance of the entertainment business to the city has led many <u>celebrities</u> to call Los Angeles and its surrounding <u>suburbs</u> home. Los Angeles <u>hosted</u> the 1932 and 1984 Summer Olympics. Such famous universities as the University of Southern California and the University of California are situated there, too.

Los Angeles enjoys a Mediterranean climate and sunny weather. It's a modern city with something for everyone. It's noisy and <u>crowded</u> but <u>fascinating</u>.

The Fascinating World of Crystals

Just what are crystals? A crystal is an organized grouping of atoms, or molecules. Each crystal has different properties and shapes. For example, sugar crystals are oblong and slanted at the ends; salt crystals are cubic. Some elements can make more than one crystalline form. Carbon, as graphite, will conduct electricity, act as a lubricant between moving parts, be used as a writing tool (a pencil) and strengthen of steel. As diamond, carbon is used as an industrial cutting tool and as a gemstone in jewelry.

Crystals can be used in many ways. Diamonds, rubies, sapphires, and emeralds have been the showiest use of crystals for thousands of years. They were highly valued due to their beauty and relative small amounts that exist in nature. In recent years chemists have been working on methods of creating some of these crystals in the laboratory with a lot of success.

Each different crystal vibrates at a specific frequency when an electric current is passed through it. The original radios were created using vibrating crystals to create the frequency to transmit signals. As radio technology improved, radio transmitters had several different crystals to allow transmission on different frequencies. Modern radios have large number of different frequencies used by radio stations.

Vibrating crystals can be used for time keeping. A quartz clock uses the vibration of a quartz crystal to measure time. When the crystal has an electric current passed through it, the crystal will vibrate at 60 hertz (60 times per second).

Lesson 24. Education in the USA

24.1. Розмовна тема. Освіта у Сполучених Штатах Америки Прочитайте текст і знайдіть підкреслені слова у словнику.

The American system of school education differs from the systems in other countries. The United States does not have a national system of education. Each state <u>determines</u> its individual standards and <u>requirements</u>. Though there are enough basic <u>similarities</u> in structure among the various schools and systems.

Elementary education begins at the age of six or seven, when a child goes to the first grade (form). The program of studies in the <u>elementary school</u> includes English, Arithmetic, Geography, History of the USA, Natural sciences and, besides, Physical Training, Singing, Drawing, wood or metal work, etc. Sometimes they learn a foreign language and general history. At the age of fourteen or sixteen schoolchildren leave the elementary school and may continue their education at one of the secondary schools or <u>high schools</u>, as they call them, where they study up to 18. There are almost always required (compulsory) subjects and sometimes students at high school can choose some optional courses. Besides giving general education some high schools teach subjects useful to those who hope to find jobs in industry and agriculture or who want to enter colleges or universities.

After graduating from secondary schools a growing number of Americans go on to higher education. There are more than 3,000 institutions of higher education in the United States with the number of students <u>ranging from</u> fewer than a hundred to 40,000. Young people who want to get higher education must meet some requirements. No student is admitted to a college or university without having completed a four-year course in high school. It means that a student who wants to study at a university or college must begin by doing good work in high school. If his grades in high school are <u>satisfactory</u>, he is admitted to a university or college. Besides, standardized examinations play a <u>decisive role</u> in the admission to most colleges and universities. About 53% of pupils who complete their high school course go on to a college or university.

Institutions of higher learning include a great variety of junior and <u>community colleges</u>, technical and professional schools, which provide two-year programs in such fields as engineering, business, or electronics; and colleges and universities (the <u>former</u> often being a part of the <u>latter</u>), which usually offer four or five-year programs leading to Bachelor of Arts (BA) or Bachelor of Science (BSc) degree, as well as <u>advanced courses</u> leading to a Master's or Doctor's degree. Any of these institutions, in any category, may be either public or private, depending on the source of its funding.

It is common for students to leave home to study, and only about 15 % of all university students live at home while they study. Students may live either in the university campus in one of the <u>dormitories</u> or in private homes in the city in which the University is located.

Вправа 1. Дайте відповіді на запитання.

1. What is the difference between the system of education in the USA and the systems in other countries? 2. What are the stages of education in the USA? 3. How long do American pupils study at school? 4. How many institutions of higher education are there in the USA? 5. How many years do American students study to get a Bachelor's degree? 6. Where do American students usually live while studying at a university or a college?

24.2. Письмові завдання

Вправа 2. Перекладіть речення про освіту у США англійською мовою.

Система освіти в США відрізняється від систем освіти в інших країнах, бо не має загальнонаціональної освітянської програми. У віці 6–7 років діти вступають до першого класу початкової школи, після якої у віці 14–16 років, вони переходять до середньої школи. Програма навчання включає як обов'язкові предмети, так і предмети за вибором. Навчання в державних школах безкоштовне. За навчання в приватних школах та коледжах батьки мають платити. Жоден студент не може бути прийнятий у вищій навчальний заклад без закінчення повного курсу середньої школи. Після 4–5 років навчання в університеті студенти отримують ступінь «бакалавр». Більшість студентів протягом навчання проживають в гуртожитках, або приватних квартирах на території університету.

24.3. Читання

Harvard University

O Active Vocabulary:

prominent – видатний; distinctly – виразно; outlook – світогляд; clergy – духовенство; scope – масштаб; to diversify – урізноманітнювати; to command respect – викликати повагу; alumnus (pl. alumni) – колишній студент (випускник); campus – територія університету; to enroll – зараховувати; the Divinity School – факультет богослов'я; vigorous – потужний.

Harvard is more than a university – it's a tradition. No other American institution of higher learning has such a prominent place in the nation's history or

States (and the oldest corporation in the Americas). It is perhaps the only US university that is both closest to the British model of university education, yet distinctly American in identity and outlook. Harvard was founded as a small institution with the mission of educating Protestant clergy. It grew as the United States did, expanding in size and scope, and diversifying its student and teaching communities. Today a Harvard degree commands respect not only in the United States, but around the world – Harvard counts seven U.S. presidents among its alumni, and over 40 Nobel laureates among its current and former faculty.

Harvard is located in Cambridge, Massachusetts, in a campus just across the Charles River from Boston. This is a highly urban setting that joins colonialera buildings and landmarks with Massachusetts' hi-tech industry. Harvard is a large university, with high-profile graduate and professional programs. Almost two-thirds of its approximately 19,500 students are enrolled in its professional and graduate schools (which include the world-famous Medical School, the Business School, the Law School, the John F. Kennedy School of Government, the Divinity School, the School of Public Health, and the Graduate School of Education). Connections made at Harvard often last a lifetime, with graduates becoming part of a vigorous network of over 270,000 alumni.

Дайте відповіді на запитання.

1. When was Harvard founded? 2. What was Harvard's initial mission? 3. How many US presidents graduated from Harvard? 4. Where is it located? 5. How many students are enrolled it its schools? 6. How long do the connections made at Harvard last?

⊙ Smile!

A young man hired by a supermarket reported for his first day of work. The manager greeted him with a warm handshake and a smile, gave him a broom and said, "Your first job will be to sweep out the store."

"But I'm a Harvard graduate," the young man replied indignantly.

"Oh, I'm sorry. I didn't know that," said the manager. "Here, give me the broom and I'll show you how."

Lesson 25. Ecology

25.1. Розмовна тема. Екологія

Прочитайте текст. Знайдіть у словнику підкреслені слова.

For millennia man had to struggle against nature in order to <u>survive</u> and develop. However, as economy developed and the scientific and technological revolution <u>increased</u>, the <u>correlation</u> of forces between man and nature changed. As a result, economic achievements began to have an increasingly negative effect on nature, on the biosphere.

Road and factory construction and industrial development take away up to 7 million hectares of land every year. Forests disappear at a rate of some 20 hectares a minute. 76 animal species and several hundred plant species of the Earth became extinct in the last 60 years alone. Each year the world economy ejects into the atmosphere over 200 million of carbon monoxide, more than 50 million tons of diverse hydrocarbons, over 120 million tons of ash and nearly 150 million tons of sulphur dioxide. They fall back upon the Earth in the form of "acid rains".

There are lots of ecological problems: pollution and impoverishment of the seas, oceans, rivers, underground waters; pollution and destruction of woods and agricultural grounds; pollution of the atmosphere; reduction of the protective ozone layer; dramatic changes of climate; rising of the ocean level; accumulation of deadly radioactive substances made by nuclear power stations; impoverishment of the vegetative and animal world; exhaustion of planet's resources.

All these ecological problems <u>are caused</u> by disturbing the natural balance in the Earth's ecosystem. Ecosystem is a community of plants, animals and homo sapiens (as a part of the world ecosystem) within a particular habitat. To study the ecosystem in relation to their <u>environment</u> is the aim of the science called ecology. Today most countries pay great attention to the <u>environmental protection</u> because our everyday life, our health and, <u>in the end</u>, the survival of the mankind depend on the solution of ecological problems <u>facing</u> the man.

Визначте, чи вірними є висловлювання.

1. All ecological problems are caused by solar activity. 2. Carbon monoxide is produced only by cars. 3. People are a part of ecosystem. 4. Ecology is a science studying insects. 5. Economic activity usually has a negative effect on nature.

25.2. Письмові завдання

В права 1. Складіть речення з частин, наведених у лівому та правому стовпчиках таблиці.

A drought happens	when there aren't enough trees
A famine happens	when there isn't enough rain
A flood happens	when there is too much carbon dioxide
Trees fall down	when there is too much rain
The world produces less oxygen	when the wind is too strong
The atmosphere becomes	when there is too much ultraviolet radiation
warmer	
There is more skin cancer	when there isn't enough food

25.3. Читання

Прочитайте текст. Доповніть список необхідних заходів зі збереження довкілля.

People still do not have so much needed ecological conscience and do not see that they are only ones responsible for salvation of our planet. It is probably too painful to admit our own mistakes and try to fix them before it is too late. Some small steps have been already done but it will take much more these steps on global level in order to make the difference. If we realize the coming danger we should find solutions to all ecological problems to survive.

- We must change people's attitude towards the environment.
- We should stop the pollution of air and water.
- We should save more energy and water and try to use other sources of energy (solar and tidal energy, the energy of the wind, subterranean hot waters, etc.).
 - We must protect the ozone layer from the harmful industrial products.
 - We should protect animals from extinction.

Lesson 26. Water Pollution 26.1. Усна тема. Забруднення води

Прочитайте текст і знайдіть підкреслені слова у словнику.

Fresh water is fundamental to the <u>survival</u> of humans and most other landbased life forms.

Ninety seven per cent of the earth's water is the salt water of oceans and seas. Most of the remaining 3 per cent is in polar ice caps, glaciers, the atmosphere or underground and hard to reach. Only 0.4 per cent is available for use. However, growing population, increased economic activity and industrialization has resulted in an increased demand for fresh water and has caused a severe misuse of water resources and their increasing pollution.

Following are the main sources of water pollution.

- Oil <u>spills</u> from ships and super-tankers, and from off-shore oil drilling operations. Oil forms a thin layer on top of water. Animals and plants living in the water can't breathe; the oil coats the feathers of water birds, and the fur of animals causing them to become sick or even to die.
- <u>Fertilizers</u> used by farmers. When fertilizers are washed into rivers and streams, the nitrates and phosphates cause <u>excessive</u> growth of water plants. It is

harmful to the fish and other <u>invertebrates</u> that live in water because it makes it hard for them to breathe.

- Sewage and other organic pollutants. When leaves, grass and wastes from farm animals enter the water, they rot and use up the oxygen in the water. A lot of types of fish and other aquatic animals cannot survive. Such microscopic pollutants as bacteria and viruses cause sickness in people and in animals that drink or live in polluted water.
- Chemicals. Chemical pollution entering rivers and streams causes great destruction of water environment. The chemicals can come from factories, construction sites, mining operations, and from homes.
- Plastics. Floating plastic is ugly and harmful to the environment. It can <u>choke</u> animals that try to eat it and drown those that get tangled in it.

How we use up water (22 March – world day for water)

- 30 litres of water go down to the drain when you shower for five minutes.
- 80 litres are used in the average bath.
- 5 litres are wasted by running the tap while brushing your teeth.
- 1,000 litres an hour are used by a garden sprinkler.
- 4 litres a day are wasted by a dripping household tap.
- 650 litres of water are used per guest per day in a hotel.
- 10,000 litres a day irrigates an 18-hole golf course.
- 1 flush of the lavatory uses as much water as the average person in the developing world uses for one day's washing, drinking, cleaning and cooking.

The Black Sea Pollution

The story about the Black Sea pollution starts like almost any other pollution story. Once, about half a decade ago, the Black Sea had very rich and diverse marine ecosystems. It also had major economic benefits in the form of millions of tourists coming from all over the world, not to mention the abundant fisheries.

But in the 1990s, this important natural resource has been brought at the brink of destruction. Once rich biodiversity became only a fond memory, and foreign tourists are no longer coming to enjoy the natural beauties that this area once offered. There is also no more fish, and tragically the Black Sea has become an area to dump all forms of solid and liquid waste.

The Black Sea is full of different pollutants such as toxic metals and agrochemicals. These substances have caused an overproduction of phytoplankton which prevents light from reaching the sea grasses and algae, thus making a huge damage to marine life.

Many tanker accidents caused oil pollution, while coastal industries continue to discharge waste products directly, with little or no treatment. This, along with huge industrial activity in the area, shipping and offshore oil exploration have created critical environmental situation.

In order to fight this pollution, the six surrounding countries signed the Bucharest convention in 1992 but this convention has so far had very little impact because several governments have not yet released the funds needed to fulfill their commitments in fight against the Black Sea pollution.

And so the pollution still continues.

Lesson 27. Air Pollution

27.1. Усна тема. Забруднення повітря

Прочитайте текст. Знайдіть у словнику та запам'ятайте підкреслені слова.

Air pollution has probably been with us since the very beginning of our <u>existence</u> on this planet, and even when man was not present.

Today, industrial activity is so great and fuel-powered transportation devices are so numerous that air pollution of human origin is starting to produce noticeable effects on a global scale. Carbon monoxide (CO) emitted by automobile engines arises from incomplete combustion of hydrocarbons found in gasoline in which the fuel reacts with less oxygen than it is theoretically possible. It is estimated that as a result of human activity about 260 million tons of carbon monoxide are released into the Earth's atmosphere every year. Automobile exhaust gases contain an average of 4–5 % CO. As to sulphur oxides, they have other bad effects in addition to those concerning human health. In high concentrations they are lethal to vegetation.

There exists one more ecological problem which is threatening the globe as a whole. The protective layer of ozone around our planet is under severe attack. In early 1980s researches first identified a yawning hole in the Antarctic where the <u>ozone layer</u> was the thinnest. Five years later it was reported that the hole had grown to an area the size of the United States. The fundamental importance of the ozone layer is that it acts as a filter intercepting most of the sun's radiation including potentially harmful ultraviolet β -rays which can cause melanoma – skin cancer.

The cause of the appearance of the arctic hole is the growing industrial use of chlorine <u>compounds</u> called chlorofluorocarbons (CFC-s). CFC is a propellant gas commonly used in aerosol sprays, air cooling systems in fridges and air conditioning. There is the need for an international agreement that would completely stop CFC production.

Визначте, чи правильними є висловлювання.

1. Industrial activity produces no effect on nature. 2. Automobile engines emit carbon monoxide. 3. Every year one ton of carbon monoxide is emitted into the atmosphere. 4. Sulphur oxides are harmful only to human health. 5. Scientists discovered the hole in ozone layer in 1917. 6. Now the ozone hole is the size of Moldova. 7. Ozone layer protects the Earth against the sun's radiation. 8. Too much ultraviolet radiation can cause only good suntan. 9. The arctic hole appeared due to the use of CFC-s. 10. CFC-s are used in nuclear reactors.

27.2. Письмові завдання

Вправа 1. Прочитайте та перекладіть письмово наступний текст.

Air pollution is a mixture of solid particles and gases in the air. Car emissions, chemicals from factories, dust, pollen and mold spores may pollute the air in big cities and small towns.

Some air pollutants are poisonous. Inhaling them can increase the chance you'll have health problems. People with heart or lung disease, older adults and children are at greater risk from air pollution. Air pollution isn't just outside – the air inside buildings can also be polluted and affect your health. Sources of indoor pollution include biological contaminants like mold and pollen, tobacco smoke, household products and pesticides, gases such as radon and carbon monoxide, materials used in the building such as asbestos, formal-dehyde and lead.

Indoor air quality problems usually only cause discomfort, and most people feel better as soon as they eliminate the source of the pollution. However, some pollutants can cause diseases that show up much later, such as respiratory diseases or cancer. Making sure that your building is well-ventilated and eliminating pollutants can improve the quality of your indoor air.

A: Can you tell me anything about smoggy cities?

B: I know that the smoggiest cities in the world are Teheran, Baghdad, Delhi, Calcutta, Athens and Madrid.

A: Really?! I didn't know that. And what is the reason?

B: It's the presence of great amount of sulphur dioxide and suspended particles in the air. Rain washes these harmful substances out of the air, and this creates "acid rain".

A: And how does it differ from the usual rain? Is acid rain harmful?

B: Certainly. It pollutes water, damages crops, forests and buildings.

A: And what about people? Does it affect people's health?

B: Of course, it does.

28.1. Усна тема. Забруднення землі

Почитайте та перекладіть діалог. Складіть речення з підкресленими виразами.

Land Pollution

- A: You know, lots of people in the world think it's important to live green.
- B: Yes, but some of them <u>are not aware</u> of how much pollution exists.
- A: So, do you know where it <u>comes from</u>?
- B: <u>As far as I know</u>, most land pollution <u>is caused by</u> industrial and commercial sources, such as factories, oil refineries and so on.
- A: <u>Does it mean that</u> we are not able to influence it?
- B: <u>Nothing of the kind</u>. First, we can help to make it known. <u>The more</u> people learn about the pollution facts, <u>the more</u> attention will be drawn to them and, I hope, the sooner these problems will be solved.
- A: I know there are new laws and regulations that are aimed at reducing the amount of commercial and industrial pollution.

B: <u>Sure</u>, but there is still more work to be done and <u>besides</u> – everyone can contribute to preserving our land clean.

A: You are right. We must learn to care for the earth in a <u>responsible</u> way to <u>sustain</u> life for ourselves and for the generations to come.

28.2. Письмові завдання

Вправа 1. Прочитайте і перекладіть письмово.

Garbage is another important source of pollution. Every year households discard 41 million cubic metres of domestic waste -1.18 cubic per urban resident. Nearly all this waste -95.7% – is dumped at one of the 656 open-air sites; only a small part is processed at one of the four garbage disposal plants operating in Ukraine. Four out of five of the open-air dumps have no facilities to protect the underground water or the air and are huge toxic areas. As a result it is necessary to prohibit the use of large land areas for 50 years since the agricultural lands around dumps suffer low productivity due to pollution of the soil and the destruction of natural micro-organisms.

28.3. Читання

Прочитайте текст та запропонуйте, що ви самі можете зробити для зменшення забруднення землі.

Here are a few land pollution facts that pertain to littering.

- Some studies show that more than 8 million gallons of litter is thrown from car windows every day.
- Of all of the items placed in <u>landfills</u> each year, nearly 80% of them could have been recycled.
- More than 30 billion non-biodegradable <u>foam</u> cups are used each year.
- More than 20 billion tons of topsoil is lost each year due to land pollutions.

In addition to using your voice to <u>spread</u> the word about how important it is to stop commercial land pollution, there are also action steps you can take today that will cut down on your personal <u>contribution</u> to land pollution.

Here are a few land pollution facts how to reduce your own waste. Buy Used

• Many of the items that you use every day can be found used. This includes clothes, furniture, household items and many more.

- You should also <u>donate</u> all of your old items to a local <u>thrift store</u> rather than throwing them away. This will not only cut down on what ends up in a landfill, but will give someone else a chance to find what they need used rather than having to buy new.
- Of course, you won't be able to find everything you need used, but you should always start your search looking for used items and only buy new when you must. This will not only help the environment, but it will save you money as well.

Eat Organic

- When you eat organic foods, you are supporting farmers that do not use pesticides which are harmful to the environment.
- Organic foods will cost a bit more, but they are better both for the environment and for your health.

Watch the **Packaging**

- When you do need to buy something new, try to find products that do not use unnecessary packaging. Such packaging accounts for a lot of what is thrown away by consumers each year.
- Write to companies that use too much packaging and let them know that you would love to buy their products, but that you will not do so until they <u>eliminate</u> what will potentially become land pollution.

29.1. Усна тема. Екологічні загрози

Знайдіть у словнику підкреслені слова. Складіть розповідь про одну з екологічних загроз, використовуючи активну лексику.

Noise Pollution

<u>Noise pollution</u> is the new <u>side effect</u> of our technological age. Day or night, various sounds fill the air. Between sunrise and sunset, streets and highways are a constant <u>source</u> of noise from cars, buses, and trucks. You can pass any factory or construction site and the roar of its <u>machinery</u> will make your ears ring. Music is played in every supermarket, most restaurants and many offices and homes.

Big cities of the world such as Los Angeles (California, USA), Osaka (Japan) are well-known for their noisiness.

We are realizing, finally, that silence is a natural resource and must be <u>protected</u> by law.

Global warming

Today our planet is warming. Some <u>impacts</u> from increasing temperatures are already happening: ice is melting worldwide, especially at the Earth's poles; the number of penguins on Antarctica have fallen from 32,000 to 11,000 in 30 years; <u>sea level</u> rise became faster over the last century; some butterflies, foxes, and alpine plants have moved farther north or to higher, cooler areas; <u>precipitation</u> (rain and snowfall) has <u>increased</u> across the globe, <u>on average</u>.

Other effects could happen later this century, if warming continues: sea levels are expected to rise between 7 and 23 inches (18 and 59 centimeters) by the end of the century; <u>hurricanes</u> and other storms <u>are likely</u> to become stronger; <u>species</u> that depend on one another may become asynchronous. For example, plants could bloom earlier than their <u>pollinating insects</u> become active; floods and droughts will become more common; less fresh water will be <u>available</u>; some diseases will <u>spread</u>, such as malaria carried by mosquitoes; ecosystems will change.

Overpopulation

With the number of people on the globe over 7 billion, the impact of human populations on the environment has been <u>severe</u>. Every year, more than 81 million people add the world-wide population. Every 10 years almost one billion more inhabitants are added.

The current effects of overpopulation are as follows: to build new settlements 16 million hectares of forest are chopped down each year; the accelerated growth of the human populations has caused the destruction of natural habitats of many bird and animal species and their extinction; about 5 million people die every year from illnesses associated to organic wastes; water necessities will increase to 20% by 2025; in USA only, consumption of materials (wood, metals, synthetics, etc.) has grown 18-fold since 1900; the ozone layer has been gradually ruined by the effect of the CFCs and as a result of huge industrial activity.

29.2. Письмові завдання

Вправа 1. Перекладіть текст письмово рідною мовою. Jet Planes Keep Us Warm at Night

Scientists have discovered an unexpected reason for climatic change: airplanes. New research has revealed that vapour trails from jet aircraft flying across the country make nights up to 1°C (1.8°F) warmer, and days 1°C cooler. The study was conducted by checking the records at 4,000 weather stations when aircrafts were grounded across the US in the aftermath of the September 11 attacks. When compared with historical averages, they discovered that those nights were colder and the days warmer, with the temperature difference between night and day rising by an average of 1.8°C. The vapour trails, which can turn into high altitude cirrus clouds in the right conditions, reflect sunlight back during the day reducing air temperature at ground level and act as an insulating layer at night helping keep warm air in.

29.3. Читання

Прочитайте текст. Знайдіть у словнику підкреслені слова. Cruise Liners Are Contaminating Our Oceans

Luxury cruise liners that carry millions of passengers to remote corners of the globe are polluting the seas and endangering marine life. The new superliners, which can accommodate up to 4,000 passengers and crew, are pumping thousands of gallons of sewage and oily bilge water into the sea every day with potentially disastrous effects on fragile ecosystems. These cruise holidays are increasingly popular but the ships are like floating cities without any rules on sewage and waste disposal. A study conducted by the American environmental group, which is dedicated solely to the protection of the Earth's oceans, has revealed that a typical ship's daily waste will include 37,000 gallons of oily bilge water; 30,000 gallons of sewage; 255,000 gallons of waste water (from showers etc.); and seven tons of rubbish. The number of cruise ships is growing every year – in 2000, 240 liners carried ten million passengers – and they are travelling to ever more exotic locations. As a result, even remote waters in Alaska are now polluted.

Вправа 2. Визначте, чи правильними є висловлювання.

1. Cruise liners often pollute seas and oceans. 2. Big liners can accommodate up to 100,000 people. 3. There are strict rules for treating wastes of ocean-going liners. 4. Ships throw no rubbish overboard. 5. Waters near Alaska are polluted with garbage thrown from the ships. 6. The activity of the American environmental group is aimed at the protection of American rivers.

Вправа 7. Вивчіть діалог напам'ять.

Is the Earth Getting Hotter?

A: Do you know anything about the "greenhouse" effect?

B: Certainly, I do. I've heard that it will soon begin altering the Earth's climate.

A: Can you say what exactly the greenhouse effect means?

B: The greenhouse effect is a process by which thermal radiation from a plane-tary surface is <u>absorbed</u> by atmospheric greenhouse gases, and is re-radiated in all directions. Since part of this re-radiation is back towards the surface, it results in an <u>elevation</u> of the <u>average</u> surface temperature.

A: Oh, I see that it is like glass in a greenhouse. It forms a kind of "thermal blanket" around the planet.

B: Yes, that's right. The thing is that the greenhouse effect will cause not only hotter summers and milder winters, but it may alter rainfall, affect crop yields and raise sea level.

Pandas. Fewer than 1,000 giant pandas remain in the wild in their homeland, Western China.

Black rhinoceros. Fewer than 2,000 of them remain in the wild. That's a 95 percent decline since 1970. Most are killed for their horns, which are ground into powder for medical purposes in Asia.

Tigers. Only 67,000 wild tigers remain. Tigers are hunted and killed for their body parts, which are used in oriental medicines.

Chimpanzees. Chimps and other primates are on the verge of becoming extinct, primarily due to the destruction of tropical rain forests, which are home for 90 percent of all primates.

Elephants. In the last 20 years, half the African elephants have been killed off. The Asian elephant population has shrunk even more. Elephants are killed for their ivory tusks, most of which are used for making jewelry.

Bees Are in Danger

Since the 1980s, beekeepers and observers of nature have been noticing that bees are disappearing, particularly in Europe and the United States. The phenomenon reached a peak during the winter of 2006–2007, when one quarter of all domesticated honey bees in the US died out, according to a report from the US Congress.

Scientific experts blame a combination of stress factors, including climate change, the use of neurotoxic insecticides, viral and fungal infections, and lack of genetic diversity among domestic bee populations.

Thanks to pollinators such as insects, birds and bats, the world's flowering plants are able to reproduce and bear fruit. Bees are among the most active pollinators, alone responsible for as much as 70–80% of reproduction in the plant world, according to a study by the France's national institute for agricultural research, INRA. Their disappearance would put the survival of wild plants and commercial crops at risk.

To Lesson 2

My family

Satomi (Japan)

There are five members in my family: my mom, dad, grandmother, brother and myself. My dad works for a golf company. My mom is a housewife. My brother is majoring in tourism at Rikkyo University. When I was four, we moved from Kanagawa to Tokyo because we bought a new house. Now, we're living with my grandma. She used to be a very energetic ikebana teacher, but she's getting old. So, we're supporting her as much as possible. I was influenced by her very much because in my childhood she mainly took care of me and I wanted to be a woman like her in every respect. Now, she's not what she used to be; however, I really love her and my family also really loves her. That's why we'll continue to look after her. As for my grandpa, he died before I was born. Therefore I don't know very much about him. One thing I know about him is that thanks to his job (teacher), he didn't have to go to the war.

Daniel (USA)

My immediate family consists of six people. I am the youngest of four children. I have an elder brother John, who is twenty-five and two sisters. Jackie is twenty-two, while Anne-Marie is twenty-eight. John graduated from the Univer-

sity of Michigan and is an engineer, while Jackie has just graduated from the University of John Carol. Anne-Marie is an attorney, and currently works for McDonalds, dealing with their corporate material. My father has been the provider for the family as a doctor, and my mother works as a secretary and housemother. My family is always there for me through the rough times, even though I see little of them now.

Sarah (USA)

My family consists of my father (George), mother (Jennifer), my elder sister Korie, me, and my younger sister Vanessa. Korie is 21, and she is a senior at the Ohio State University. She has a double major of journalism and political science and is an editor of the school's newspaper, the Lantern. She plans to graduate after the summer quarter. My little sister, Vanessa, is 5 years old, and is in her last year of pre-school. She will start kindergarten next year. My father and mother are both alumni of the Ohio State University. My father works for Conrail/CSX, and my mother as a family and consumer sciences teacher for Benjamin Logan High School. My parents made our family's home in Belle Center in 1980. This was after living in Marysville, Ohio, and Runnemede, New Jersey, respectively. The house that we call home now has always been home to me.

To Lesson 4

Albert Einstein

Albert Einstein was born in Germany in 1879. He enjoyed classical music and played the violin. One story Einstein liked to tell about his childhood was of a wonder he saw when he was four or five years old: a magnetic compass. The needle's invariable northward swing, guided by an invisible force, profoundly impressed the child. The compass convinced him that there had to be "something behind things, something deeply hidden".

Even as a small boy Albert Einstein was self-sufficient and thoughtful. According to family legend he was a slow talker, pausing to consider what he would say. His sister remembered the concentration and perseverance with which he would build houses of cards.

Albert Einstein's first job was that of patent clerk.

In 1933, he joined the staff of the newly created Institute for Advanced Study in Princeton, New Jersey. He accepted this position for life, living there until his death. Einstein is probably familiar to most people for his mathematical equation about the nature of energy, $E=MC^2$.

Albert Einstein wrote a paper with a new understanding of the structure of light. He argued that light can act as though it consists of discrete, independent particles of energy, in some ways like the particles of a gas. A few years before, Max Planck's work had contained the first suggestion of discreteness in energy, but Einstein went far beyond this. His revolutionary idea seemed to contradict the universally accepted theory that light consists of smoothly oscillating electromagnetic waves. But Einstein showed that light quanta, as he called the particles of energy, could help to explain phenomena being studied by experimental physicists. For example, he made clear how light ejects electrons from metals.

There was a well-known kinetic energy theory that explained heat as an effect of the ceaseless motion of atoms; Einstein proposed a way to put the theory to a new and crucial experimental test. If tiny but visible particles were suspended in a liquid, he said, the irregular bombardment by the liquid's invisible atoms should cause the suspended particles to carry out a random jittering dance. One should be able to observe this through a microscope, and if the predicted motion were not seen, the whole kinetic theory would be in grave danger. But just such a random dance of microscopic particles had long since been observed. Now the motion was explained in detail. Albert Einstein had reinforced the kinetic theory, and he had created a powerful new tool for studying the movement of atoms.

Einstein's researches are, of course, well chronicled and his more important works include Special Theory of Relativity (1905), Relativity (English translations, 1920 and 1950), General Theory of Relativity (1916), Investigations on Theory of Brownian Movement (1926), and The Evolution of Physics (1938). Among his non-scientific works *About Zionism* (1930), *Why War?* (1933), *My Philosophy* (1934), and *Out of My Later Years* (1950) are perhaps the most important.

Albert Einstein received honorary doctorate degrees in science, medicine and philosophy from many European and American universities. During the 1920's he lectured in Europe, America and the Far East and he was awarded Fellowships or Memberships of all the leading scientific academies throughout the world. He gained numerous awards in recognition of his work, including the Copley Medal of the Royal Society of London in 1925, and the Franklin Medal of the Franklin Institute in 1935.

Einstein's gifts inevitably resulted in his dwelling much in intellectual solitude. Music played an important role in his life. He married Mileva Marie in 1903 and they had a daughter and two sons; their marriage was dissolved in 1919 and that very year he married his cousin, Elsa Lowenthal, who died in 1936. He died on April 18, 1955 at Princeton, New Jersey.

Marie Curie

Marie Sklodowska-Curie, one of the few people to win two Noble Prizes in different fields, was one of the most significant researchers of radiation and its effects as a pioneer of radiology. Until her granddaughter recently had them decontaminated her notes were radioactive.

Marie Curie (Polish Maria Sklodowska-Curie, born November 7, 1867, died July 4, 1934) was a chemist pioneer in the early field of radiology and a two-time Nobel laureate. She also became the first woman ever appointed to teach at the Sorbonne. She was born in Warsaw, Poland, and spent her early years there, but in 1891 at age 24 moved to France to study science in Paris. She obtained all her higher degrees and conducted her scientific career there and became a naturalized French citizen. She founded the Curie Institutes in Paris and in Warsaw.

After finishing high school, she suffered a mental breakdown for a year. Due to her gender and Russian anti-Polish reprisals following the January Uprising, she was not allowed admission into any universities so she worked as a governess for several years. Eventually, with the monetary assistance of her elder sister, she moved to Paris and studied chemistry and physics at the Sorbonne, where she became the first woman to teach.

At the Sorbonne she met and married another instructor, Pierre Curie. Together they studied radioactive materials, particularly the uranium pitchblende

ore, which had the curious property of being more radioactive than the uranium extracted from it. By 1898 they deduced a logical explanation: that the pitchblende contained traces of some unknown radioactive component which was far more radioactive than uranium; thus on December 26th Marie Curie announced the existence of this new substance.

Over several years of unceasing labour they refined several tons of pitchblende, progressively concentrating the radioactive components, and eventually isolated initially the chloride salts (refining radium chloride on April 20, 1902) and then two new chemical elements. The first they named polonium after Marie's native country, and the other was named radium from its intense radioactivity.

Together with Pierre Curie and Henri Becquerel, she was awarded the Nobel Prize in Physics in 1903: "in recognition of the extraordinary services they have rendered by their joint researches on the radiation phenomena discovered by Professor Henri Becquerel". She was the first woman to be awarded a Nobel Prize.

Eight years later, in 1911, she received the Nobel Prize in Chemistry "in recognition of her services to the advancement of chemistry by the discovery of the elements radium and polonium, by the isolation of radium and the study of the nature and compounds of this remarkable element". In an unusual move, Curie intentionally did not patent the radium isolation process, instead leaving it open so the scientific community could research unhindered.

In her later years, she was disappointed by the myriad of physicians and makers of cosmetics who used radioactive materials without precautions.

Her death near Sallanches in 1934 was from leukemia, almost certainly due to her massive exposure to radiation in her work.

Element 96 Curium (Cm) was named in her and Pierre's honour.

George and Robert Stephensons

George Stephenson won world-wide acclaim with his "Rocket" but he said that much of the credit belonged to his son Robert. Robert supervised the building of the "Rocket", and later improved some parts in its construction.

Father and son were always very friendly. Robert was born in 1803, and his mother died before he was three years old. This brought the boy nearer to his father.

One thought above all others was in George Stephenson's mind: at all costs Robert should have some schooling. He worked long and hard to send the boy first to a village school, then to a school in Newcastle. Robert wore clothes made by his father and went to school on a donkey, because there was no money to buy a horse.

Robert's first period of schooling ended when he was twelve, but during his few years of schooling he was a teacher as well a pupil, because what he learned by day he taught his father in the evening.

In 1815 George Stephenson invented a miner's lamp – the *Georgie lamp*, as it is still called, for use in the mines. For this invention he was given a large sum of money and so he could send Robert to Edinburgh University for a sixmonth course. From that time on, for many years, father and son worked closely together.

In 1821, when George Stephenson was asked to make a survey for the Stockton to Darlington Railway, his chief assistant was Robert.

They worked closely together again when they built the Liverpool to Manchester Railway. Then, as George Stephenson grew older and could not work much, he watched with pride as Robert gained achievements on his own, without his father's help.

Robert Stephenson built, for example, the Birmingham to London Railway, the first line to the British capital. For many years he built railways all over the world. Yet he is perhaps better remembered as a bridge-builder. He built bridges in Britain, in Canada and on the Nile.

A monument to father and son was erected in Westminster Abbey.

Thomas Alva Edison

O Active Vocabulary:

his teacher thought him very stupid – вчитель вважав його дуже дурним; boxed his ear – сильно вдарив його у вухо: on the track – на рельсах.

Edison was a thoughtful little boy. He was very inquisitive and always wanted to know how to do things. He was not very strong, and went to school when he was quite a big child. But his teacher thought him very stupid because he asked so many questions. So his mother, who was a teacher, took him away from school at the end of two months and taught him at home. With such a kind

teacher, he made progress; and above all, he learned to think. His mother had some good books and there was an encyclopedia among them. It was probably from the encyclopedia that he first took an interest in chemistry. He liked to make experiments, so he bought some books, and made a little laboratory in the cellar of his home.

When he was twelve years old, he started to earn his living and became a newsboy on the train which ran from Port Huron to Detroit. There was a corner in the baggage car where he kept his stocks of newspapers, magazines and candies. He moved his little laboratory and library of chemical books to this corner, and when he was not busy, went on with his experiments. All went well for two or three years. But when he was in his sixteenth year, one day a phosphorus bottle broke on the floor. It set fire to the baggage car, and the conductor not only put the boy off the train, but soundly boxed his ear. That was the most unfortunate part of the accident, for as a result Edison gradually lost his hearing, and became almost deaf.

Once he was standing on the platform of the station in Michigan, watching a coming train, when he saw the station agent's little boy on the track right in front of the coming engine. Another moment and the child would have been crushed; but Edison sprang to the track, seized the little one in his arms, and rolled with him to one side, just in time to escape the wheels. To show his gratitude the baby's father offered to teach Edison telegraphy. Working at telegraphy he at the same time spent all the spare moments in the study of chemistry and electricity. Experimenting he improved telegraph apparatus. About the same time Edison made an improvement in the transmitter of the telephone which made it easier for the waves to travel, and improved the usefulness of the telephone very much. It was just about the same time that he invented the phonograph. This is the parent idea of the gramophone, dictaphone and other instruments, but these inventions are only a small part of the work of this wonderful man.

Travelling by Train

Travelling by train is generally much cheaper than any other fast means of travelling. Moreover, train is one of the most efficient and reliable vehicle in which you don't have to go through any traffic jams. Travelling by train may be a quite unique and leisurely experience, as you can do so many things while travelling such as: making new friends, taking a walk, chatting with other travelers, playing cards, looking at the views, reading or just sleeping. In short you

can have a lot more fun in train than you would have if you were travelling by car which requires you to be alert all the time.

Some tips for rail travel in Europe.

Ticketing

- Be aware that it can be very expensive in some countries to travel by train. Especially high speed trains can be as expensive as but more convenient than flying.
- If you can, book in advance. In many countries you may benefit from a substantial discount.
- Many countries offer passes, allowing several journeys to be made within a region. Inter Rail (for Europeans) and Eurail (for others) are good value for those who qualify and wish to travel extensively through Europe.
- Please buy your ticket through the Internet, in a ticket office or a ticket machine before joining the train or otherwise you may have to pay a higher price or a fine.

Boarding and accommodation on board

- Find out if the class of the car you are boarding is in the front, middle or rear of the train and stay on the platform accordingly. Ask the staff on the platform. In some countries, stations are divided into zones and diagrams show you what zone your coach number corresponds to.
- Many trains have first class accommodation. This can be available in some cases, or very expensive in others. You are paying (typically) for a wider seat and a much emptier compartment. Do not, under any circumstances, travel in first class unless you have a ticket or other permission to do so.
- Normally, the doors of a train do not open automatically. So to enter or exit a coach you have to push a button on the door or turn a handle.
- Tuck away your luggage as much as you can. Don't let it block the way or the seats for other passengers.
- For overnight journeys, consider investing in a couchette or sleeper compartment, which are often cost-competitive with lodgings for the night. A couchette cabin has 6 berths for sleeping and no other facilities around, while a full-fledged sleeper will have two to four berths and possibly bathing facilities like a sink or a shower.

Tipping in America

Americans take tipping more seriously than any other nationality, and of all Americans, no one takes tipping as seriously as hotel bellboys do.

Tip your bellboy generously, and you will have the perfect holiday. Do not tip him, and you will have the worst holiday of your life!

Guests who do not tip well at hotels often find that the heating in their room "accidentally" stops working in the middle of winter, or that they receive strange phone calls in the middle of the night.

Sometimes the keys for their room "disappear" and it seems that no one can find the spare keys.

It is a good idea to tip a bellboy at least 5 dollars and, for tips of 20 dollars or more, your bellboy will be your friend forever. So, anyone who is planning to stay in an American hotel should remember – bellboys can make sure you have the holiday of your dreams ... or they can make your visit a nightmare!

Massachusetts Institute of Technology (MIT) Department of Nuclear Science and Engineering

Nuclear Science and Engineering is an intellectually exciting and socially important discipline, supporting a wide range of applications.

Our department presently consists of 28 faculty and senior research staff, 101 graduate and 48 undergraduate students. The curriculum includes over 70 subjects of instruction, leading to the B.S., M.S., N.E., and Ph.D. degrees.

Our goal is to educate individuals to become future leaders and make fundamental contributions in each of the following three programs:

Fission Engineering and Nuclear Energy

Fusion and Plasma Physics

Nuclear Science and Technology

Research opportunities extend across all aspects of nuclear science and engineering enhanced by the use of world-class experimental facilities located on campus, including:

MITR-II, a 5-megawatt nuclear research reactor;

Alcator C-Mod, a high field tokamak fusion device;

Multi-accelerator laboratory, focusing on medical and industrial applications;

Multi-magnet nuclear magnetic resonance laboratory, focusing on medical imaging and quantum information processing.

Students also have access to state-of-the-art computational facilities.

Established in 1958, the Department of Nuclear Science and Engineering at MIT is one of the oldest Nuclear Science and Engineering graduate programs in the country. Still, compared to more traditional engineering disciplines, nuclear engineering is a relatively new addition to university educational programs. The field defines its education and research mission broadly as the study of nuclear and radiation interactions and their applications to problems of beneficial interest to society. Given that we have only recently begun to understand basic nuclear processes, nuclear engineering is still in its "pioneering" phase with regard to its impact on our lives.

University of Oxford The Department of Chemistry

Each year some 170 chemists graduate after a four-year course which includes a year of research and about 80 graduates receive doctorates.

The Oxford Chemistry course is second to none in quality.

It has been judged to be excellent following a Teaching Quality Audit (TQA) by the Higher Education Funding Council for England (HEFCE). Furthermore, the research school of 74 faculty was awarded 5* (also the highest

grade) in the most recent Research Assessment Exercise, published in December 2001, an evaluation that recognises its considerable international standing.

Her Majesty the Queen opened the new £60 million Chemistry Research Laboratory on 20th February 2004. This state of the art facility has five floors covering ~17,000 sq.m of laboratory and office space. The £60 million has been raised with grants from the JIF, Wolfson Foundation, EP Abraham Trust, Thomas Swan, the family of Landon T Clay, the Salters Company and a £20 million partnership with IP Group.

University of Cambridge The Department of Physics at the Cavendish Laboratory

The Cavendish Laboratory was founded in 1871, along with the appointment of James Clerk Maxwell as the first Cavendish Professor. It has a distinguished intellectual history, with 29 Nobel prizewinners who worked for considerable periods within its facilities, and is associated with many notable discoveries, including the electron and the structure of DNA. In 1973, the Laboratory moved from the historic centre of Cambridge to a green-field site, a mile west of the city centre. This formed the nucleus for the Universities development of a new physical science campus in West Cambridge.

The Department of Physics, housed in the Cavendish Laboratory, is large. Currently there are 65 teaching staff, approximately 150 postdoctoral fellows, about 250 graduate students in total (including administrative and technical support staff), a complement of 700 people. Total research grant income was over £14M in 2004/5, and has roughly doubled during the last decade. The Department (jointly with the Institute of Astronomy), was rated 5* (the highest possible) in the 2001 National Research Assessment Exercise performed by the Higher Education Funding Council for England (HEFCE). The undergraduate teaching programme is a vigorous one, with about 120 students annually proceeding to the 4-year MSci degree in Physics. During the first year, about 400 students take physics as part of the Natural Sciences Tripos. In the 1998 HEFCE subject review of teaching, the Department scored 23 out of a possible 24.

Research activities span all the areas of physics, and are organised under major research groupings: High Energy Physics, Astrophysics, Biological and Soft Systems, Semiconductor Physics, Optoelectronics & Microelectronics, Quantum Matter, Theory of Condensed Matter, and Physics and Chemistry of Solids.

School Life for a British Boy (Written by Erik)

My School is a mixed 11–18 school. There are about 1,150 students in my school, including 200 in the sixth form. It is called a Technology College and specializes in Computers and Maths. My school has over 1200 computers (including over 400 tablet PC's)

I am in Year 8. I am presently having to decide what GCSEs I would like to start working towards. I am sitting for my GCSE exams next year instead of the year after when most other people of my age will be doing them.

Some subjects are <u>compulsory</u> like Maths, English, Science and a foreign language. I am not sure what other GCSEs I will be taking. I will have to decide soon.

My School Day

I leave home at 6:45 and walk 20 minutes to catch a bus to school. The bus is a special one just for kids going to my school. The journey on the bus takes an hour because it has to keep stopping to pick up other students along the way.

When I arrive at school, I collect my Tablet PC from the Flexi (Flexiable Learning Centre). Then I go to my Tutor Room for Registration at 8:30.

What is Registration?

The <u>attendance</u> of every child attending school each morning and afternoon is recorded in a special book. The teacher reads out each child's name in turn. On hearing his/her name, the child replies 'yes Mrs. (teacher's name)' and the teacher notes down in the book whether the child is in school or not.

We listen to <u>announcements</u> to see what special things are happening at school today or this week.

At about 8:50 we leave Tutor Room to go to our First <u>Period</u>. Every day I have a different Lesson the first period. Normally it is <u>Humanities</u> but I also

have Maths, Drama and Music, and French on the other days. Each period lasts an hour.

All my lessons are in different rooms and places around the school. Each Room either has a three digit number or a name. The numbers are very hard to remember! I have different teachers for each lesson. I have a <u>locker</u> where I can store some of my stuff but otherwise I have to carry it all around with me in my bags.

Swipe Cards

Every Student carries a swipe card. We swipe into every lesson to let the school know that we have attended that certain lesson and where we are in case of <u>emergencies</u>.

There are two <u>stripes</u>, a black and a brown, on the Swipe Card. The brown is to swipe into lessons and the black is to get into the toilets and buildings.

We can put money on our Swipe cards instead of carrying cash around. When we want to pay for <u>snacks</u> at the shop or the canteen we just hand over our cards and they <u>deduct</u> the money.

Subjects

Maths, English, Science, <u>ICT</u>, Drama, Music, Art, <u>PE</u>.

Humanities (History, Geography, and Religion), French or Spanish.

Time Table

9:00 1st Period

10:00 2nd Period

11:00 – 11:20 Break

During the break, I have a snack and play and chat with my friends. Usually we play a chasing game. Snow ball fight when it snows is dead fun.

11:20 3rd Period

12:30 4th Period

1:30 - 2:10 Lunch

I bring a packed lunch to school but <u>occasionally</u> I have school dinners in the School Canteen. School lunches are priced at £1.60.

2:10 5th Period

3:10 End of School

Sometimes I stay after school for clubs.

Canteen

The Canteen is open at Lunch Time and Break Time. Most hot food is served only at lunch time. Chips are only available on Mondays and Fridays.

Tablet PC

We don't use our Tablet PCs in all lessons because some rooms do not have enough <u>power sockets</u>. We use the Tablets to do our work on and to search the Internet. Our Tablet PCs are connected to a Network so we can send our work straight to our teachers, and they can send them back with their comments.

<u>Incinerators</u> and <u>landfills</u> are both attempts to answer the question, "what do we do with waste?" Over the last century, governments have invested billions of dollars in increasingly <u>sophisticated</u> technologies in the vain hope of making waste disappear. Yet neither incinerators nor landfills truly <u>dispose of</u> waste; each creates significant, <u>hazardous</u> byproducts and generates additional waste streams that require further management. This is because waste, like all matter, can never truly be destroyed. The current paradigm of waste management attempts to <u>impose</u> a linear production model on a cyclical ecosystem.

In the linear model of the human economy, materials are first <u>extracted</u> from nature, then <u>processed</u> into goods, then consumed, and finally <u>discarded</u>. The <u>challenge</u>, therefore, is not merely to find a new method of dealing with waste, but to completely change the manner in which materials flow through human society. At the same time, human discards must be fed back into the

economy in ways that reduce the pressure on natural resources. At that point, they are no longer wastes, but resources.

Alternative <u>approaches</u> must begin by questioning the fundamental <u>assumptions</u> of traditional waste management. These include the ever increasing quantity of waste generated, the mixing of <u>disparate</u> materials in the waste stream, and failure of much industrial design to take wastes properly into account. Waste generation is often projected to increase without limit for the <u>foreseeable</u> future. But it should be obvious that waste – and therefore resource consumption – cannot grow infinitely on a finite planet.

Waste management must therefore be replaced by materials management: creating a closed <u>loop</u> economy that neither generates significant wastes nor <u>consumes</u> resources beyond their replacement rate. In order to achieve this closed-loop economy, true waste (material that is of no use and must be disposed) must be differentiated from discards: materials that are of no further use to their present owner but are still a resource to be fed back into the economy. This means an end to the mixed waste stream. When discards are mixed, they become useless and appear to require large-scale disposal technologies to manage them.

Currently, waste management is treated as wholly unrelated to an economy's production and consumption patterns. Governments collect and manage most waste while private firms and consumers produce it. As a result, private businesses shift a significant portion of their costs onto society as a whole by not taking responsibility for their waste streams and by manufacturing products that cannot readily be recycled. Even when producers do have responsibility for their wastes, such as process wastes from a factory, they rarely pay the full cost of managing them. Incineration and landfilling merely transfer the problem to other populations and future generations. Large-scale industrial redesign is needed to eliminate wastes that result from production and change products so that they may be recycled.

<u>Ultimately</u>, an effective program for dealing with waste is more about materials management than about technology. Although the details vary considerably, three principles are the key to solving the waste problem: <u>prevention</u>/minimization, waste stream <u>segregation</u> and industrial redesign.

Дайте відповіді на запитання.

1. What are the traditional ways of waste disposal? 2. Why are incinerators and landfills harmful to the environment? 3. What is meant by a linear production model? 4. What is a true waste? 5. Spray-On Solar-Power Cells Are True Breakthrough

Scientists have invented a plastic <u>solar cell</u> that can turn the sun's power into electrical energy, even on a cloudy day. The plastic material uses nanotechnology and contains the first solar cells able to <u>harness</u> the sun's invisible, infrared rays. It is a real <u>breakthrough!</u> The theorists predict that plastic solar cells could one day become five times more efficient than current solar cell technology.

Like paint, the <u>composite</u> can be sprayed onto other materials and used as portable electricity. A sweater coated by the material could power a cell phone or other <u>wireless</u> devices. A hydrogen-powered car painted with the <u>film</u> could potentially <u>convert</u> enough energy into electricity to continually recharge the car's battery.

The researchers <u>envision</u> that one day "solar farms" consisting of the plastic material could be rolled across deserts to generate enough clean energy to supply the entire planet's power needs.

"The sun that reaches the Earth's surface <u>delivers</u> 10,000 times more energy than we consume", said Ted Sargent, an electrical and computer engineering professor at the University of Toronto. Sargent is one of the inventors of the new plastic material. "If we could cover 0.1 percent of the Earth's surface with [very efficient] large-area solar cells", he said, "we could in principle satisfy all of our energy needs with a source of power which is clean and <u>renewable</u>".

Infrared Power

Plastic solar cells are not new. But existing materials are only able to harness the sun's visible light. While half of the sun's power lies in the visible spectrum, the other half lies in the infrared spectrum.

The new material is the first plastic composite that is able to harness the infrared portion.

"Everything that's warm gives off some heat", Sargent said. "So there actually is some power remaining in the infrared spectrum, even when it appears to us to be dark outside".

The researchers combined specially designed nano-particles called quantum dots with a polymer to make the plastic that can detect energy in the infrared. With further advances, the new plastic "could allow up to 30 percent of the sun's radiant energy to be harnessed, compared to 6 percent in today's best plastic solar cells", said Peter Peumans, a Stanford University electrical engineering professor, who studied the work.

Electrical Sweaters

The new material could make technology truly wireless. Sargent said that the plastic <u>coating</u> could be woven into a shirt or sweater and used to charge an item like a cell phone.

"A sweater is already absorbing all sorts of light both in the infrared and the visible", said Sargent. "Instead of just turning that into heat, as it currently does, imagine if it were to turn that into electricity".

Other possibilities include energy-saving plastic sheeting that could be spread on a rooftop to supply heating needs, or solar cell window coating that could let in enough infrared light to power <u>home appliances</u>.

APPENDIX IV. SUPPLEMENTARY READING

Text 1. What Are Fossil Fuels?

Fossil fuels form from the remains of plants and animals that died millions of years ago. Over time, these remains sank to the bottom of the seas and oceans, and as layers grew on top of them they were subjected to enormous pressure and heat, causing the remains to break down into hydrocarbons, or compounds made of hydrogen and carbon. When these hydrocarbons are burned, the energy they release can be used to power cars, produce electricity and heat homes.

Text 2. Where do Rainbows Come from?

Light bends as it travels from one location to another, due to the different speeds at which it travels through different mediums. This process of natural bending **is referred to as** refraction. When light passes through a prism, the different colours of the light refract out at different angles, dispersing and becoming individually visible to the human eye. The same principle applies when light passes through a droplet of water in the air. If enough light passes through enough droplets in a confined area, the refracted pattern of light is visible to humans as a bent stripe of multiple colours, known everywhere as a rainbow.

Text 3. Where Does Metal Come From?

Most metal is mined straight out of the earth in the form of ore. Ore is any part of the Earth's crust, often a mixture of rocks, loose soil and other earthy materials, from which a valuable material can be extracted. This can be difficult, since the desirable metal is often locked in chemical compounds with other unwanted materials and filled with impurities. Ore refiners must find the best way to separate each useful element from the rest of the ore in which it lies. One common method of extraction is smelting, which is where refiners heat the ore to extremely high temperatures with the use of powerful furnaces. This makes it easier to get the pure metals out. In the refining of iron, for instance, the smelting process releases unwanted particles of oxygen that populate raw iron ore.

Text 4. How Did the Computer Mouse Come into Being?

The development of the computer mouse as an essential input device followed on the heels of numerous changes to the operating environment of personal computers. Initially, there was no need for a mouse, because there was nothing to point to on a computer screen. Early computers had primitive interfaces that used crude methods to receive data, like punch cards or teletype machines. Once graphical user interfaces were created, however, and pointing became an essential part of interacting with a computer, the mouse soon became the input device of choice in personal computing. The first mouse to have commercial success debuted with Apple's Macintosh computer in 1984.

Text 5. What Are the Negative Social Effects of Computer Addiction?

Like any other addict, computer addicts can suffer from a variety of harmful side effects from their obsessive behavior. The most common and evident negative side effect revolves around the addict's social life. Most computer addicts will completely withdraw from their friends and family so they can have more time to spend on the computer, whether e-mailing, chatting, viewing pornography or playing games. Ultimately, the addicts will almost always completely withdraw from their real social world and delve deeper into their cyber world. Gamers, especially, can begin to consider things happening in their virtual gamer's world as more important than anything in their real lives. Many times these addicts will end up having trouble navigating real social situations.

Text 6. What Is Lava?

Lava is the molten or melted rock that is forced from volcanoes and cracks within the Earth's surface, **as well as** what is left behind once it cools and hardens. Cooled lava has formed many mountains and island chains, and much

of it eventually becomes lush and productive soil. Lava is made up of mostly silicon dioxide, and geologists believe magma (the term used to describe the molten rock deep within the Earth) is created under extreme pressure and temperatures at great depths below the Earth's crust. When a volcano erupts, molten rock is forced up through the Earth's crust and expelled out as lava, which can reach temperatures **as high as** 2,000 degrees Fahrenheit (1,200 degrees Celsius).

Text 7. What do we know about the surface of Mars?

Ever since the first successful flyby over Mars in 1964, scientists have been striving to gather more and more information about our rusty-red planetary neighbor. What we know already, based on soil and rock samples, as well as our observation of the planet, is that Mars is dusty, dry and cold. Its surface is heavily dotted with deep craters in some areas, while other areas have volcanic mountains even higher than Earth's highest volcano. Mars also has low-lying plains where scientists have discovered evidence of wind streaks, dunes and basins that resemble riverbeds. There are canyons on Mars, far deeper than our canyons

on Earth, as well as polar regions – icy caps made up mostly of frozen carbon dioxide. Evidence suggests that liquid water once flowed over the surface of Mars. But **as far as we know** today, Mars remains a dry, rocky planet pummeled by dust storms and pocked with crater cavities.

rechargeable	такий, що можна	tailpipe	вихлопна труба
	перезаряджати		
unlike	на відміну від	utility company	комунальна компанія
to improve	удосконалювати	smokestack	димар

An electric car is powered by an electric motor instead of a gasoline engine. The electric motor gets energy from a controller, which regulates the amount of power based on the driver's use of an accelerator pedal. The electric car (also known as electric vehicle or EV) uses energy stored in its rechargeable batteries, which are recharged by common household electricity.

Unlike a hybrid car – which is fueled by gasoline and uses a battery and motor to improve efficiency – an electric car is powered exclusively by electricity. Historically, EVs have not been widely adopted because of limited driving range before needing to be recharged, long recharging times, and a lack of commitment by automakers to produce and market electric cars that have all the creature comforts of gas-powered cars. That's changing. As battery technology improves – simultaneously increasing energy storage and reducing cost – major **automakers** are expected to begin introducing a new generation of electric cars.

Electric cars produce no tailpipe emissions, reduce our dependency on oil, and are cheaper to operate. Of course, the process of producing the electricity moves the emissions further upstream to the utility company's smokestack – but even dirty electricity used in electric cars usually reduces our collective carbon footprint.

to slide	ковзати	to handle	мати справу з чимось
to cause	викликати	log	колода
to reduce	зменшувати	to withstand	витримувати
flywheel	махове колесо	concave	угнутий

Have you ever wondered how things like inline skate wheels and electric motors spin so smoothly and quietly? The answer can be found in a neat little machine called a bearing.

The bearing makes many of the machines we use every day possible. Without bearings, we would be constantly replacing parts that wore out from friction.

The concept behind a bearing is very simple. Things roll better than they slide. The wheels on your car are like big bearings. If you had something like skis instead of wheels, your car would be a lot more difficult to push down the road. That is because when things slide, the friction between them causes a force that tends to slow them down. But if the two surfaces can roll over each other, the friction is greatly reduced.

Bearings reduce friction by providing smooth metal balls or rollers, and a smooth inner and outer metal surface for the balls to roll against. These balls or rollers "bear" the load, allowing the device to spin smoothly.

There are several types of bearings, and each has its own interesting uses, including magnetic bearings and giant roller bearings.

Magnetic Bearings. Some very high-speed devices, like advanced flywheel energy storage systems, use magnet bearings. These bearings allow the flywheel to float on a magnetic field created by the bearing. Some of the flywheels run at speeds in excess of 50,000 revolutions per minute (rpm). Normal bearings with rollers or balls would melt down or explode at these speeds. The magnetic bearing has no moving parts, so it can handle these incredible speeds.

Giant Roller Bearings. Probably the first use of a bearing was back when the Egyptians were building the pyramids. They put round logs under the heavy stones so that they could roll them to the building site. This method is still used today when large, very heavy objects like the Cape Hatteras lighthouse need to be moved.

Earthquake-Proof Buildings. The new San Francisco International Airport uses many advanced building technologies to help it withstand earthquakes. One of these technologies involves giant ball bearings. The 267 columns that support the weight of the airport each ride on a 5-foot-diameter (1.5-meter) steel ball bearing. The ball rests in a concave base that is connected to the ground. In the event of an earthquake, the ground can move 20 inches (51 cm) in any direction. The columns that rest on the balls move somewhat less than this as they roll around in their bases, which helps isolate the building from the motion of the ground. When the earthquake is over, gravity pulls the columns back to the center of their bases.

to rank	займати місце	to share	ділитися

Diamonds are found as rough stones and must be processed to create a sparkling gem that is ready for purchase.

Diamonds are the crystallized form of carbon created under extreme heat and pressure. It's this same process that makes diamonds the hardest mineral we know of. A diamond ranks a 10 on the Mohs Hardness Scale. The Mohs Scale is used to determine the hardness of solids, especially minerals. It is named after the German mineralogist Friedrich Mohs. Here's the scale, from softest to hardest:

talc – easily scratched by the fingernail;

gypsum – just scratched by the fingernail;

calcite – scratches and is scratched by a copper coin;

fluorite – not scratched by a copper coin and does not scratch glass;

apatite – just scratches glass and is easily scratched by a knife;

orthoclase – easily scratches glass and is just scratched by a file;

quartz – (amethyst, citrine, tiger's-eye, aventurine) not scratched by a file;

topaz – scratched only by corundum and diamond;

corundum – (sapphires and rubies) scratched only by a diamond;

diamond – scratched only by another diamond.

Even though diamond is only one level higher on the scale than corundum, diamond can be anywhere from 10 to hundreds of times harder than this class of gems.

It is the molecular structure of diamonds that makes them so hard. Diamonds are made of carbon atoms linked together in a lattice structure. Each carbon atom shares electrons with four other carbon atoms, forming a tetrahedral

unit. This tetrahedral bonding of five carbon atoms forms an incredibly strong molecule. Graphite, another form of carbon, isn't as strong as diamond because the carbon atoms in graphite link together in rings, where each atom is only linked to one other atom.

Text 11. Are Cell-phones Harmful?

Active Vocabulary:

cell phone	стільниковий телефон	frequency	частота
proximity	близькість	available	наявний

exposure	піддавання	to dissipate	розсіювати
tissue	тканина	vulnerable	уразливий
to alter	змінювати	ailment	нездужання
lead	свинець	fatigue	втома

All cell phones emit some amount of electromagnetic radiation. Given the close proximity of the phone to the head, it is possible for the radiation to cause some sort of harm to the 118 million cell-phone users in the United States. What is being debated in the scientific and political arenas is just how much radiation is considered unsafe, and if there are any potential long-term effects of cell-phone radiation exposure.

There are two types of electromagnetic radiation:

- Ionizing radiation. This type of radiation contains enough electromagnetic energy to strip atoms and molecules from the tissue and alter chemical reactions in the body. Gamma rays and X-rays are two forms of ionizing radiation. We know they cause damage, which is why we wear a lead vest when X-rays are taken of our bodies.
- Non-ionizing radiation. Non-ionizing radiation is typically safe. It causes some heating effect, but usually not enough to cause any type of long-term damage to tissue. Radio-frequency energy, visible light and microwave radiation are considered non-ionizing.

On its Web site, the FDA states that "the available scientific evidence does not demonstrate any adverse health effects associated with the use of mobile phones." However, that doesn't mean that the potential for harm doesn't exist. Radiation can damage human tissue if it is exposed to high levels of RF radiation, according to the FCC. RF radiation has the ability to heat human tissue, much like the way microwave ovens heat food. Damage to tissue can be caused by exposure to RF radiation because the body is not equipped to dissipate excessive amounts of heat. The eyes are particularly vulnerable due to the lack of blood flow in that area.

The added concern with non-ionizing radiation, the type of radiation associated with cell phones, is that it could have long-term effects. Although it may not immediately cause damage to tissue, scientists are still unsure about whether prolonged exposure could create problems. This is an especially sensitive issue today, because more people are using cell phones than ever before. In 1994, there were 16 million cell-phone users in the United States alone. As of July 17, 2001, there were more than 118 million.

Here are a few illnesses and ailments that have potential links to cell-phone radiation: cancer, brain tumors, Alzheimer's, Parkinson's, fatigue, headaches.

If you are worried about the potential hazards of cell-phone radiation, here are a few ways to reduce your risk:

- Use a hands-free headset.
- Use a phone that places the antenna as far away from you as possible.
- Extend the antenna during use.
- Limit calls inside buildings.
- Limit use by children.

The Internet is a global system of interconnected computer networks linked by a broad range of electronic and optical networking technologies. The Internet carries a lot of information resources and services, especially the inter-linked hypertext documents of the World Wide Web (WWW) and the infrastructure to support electronic mail.

Most traditional communications media, such as telephone and television services, are reshaped using the technologies of the Internet, giving rise to services such as Voice over Internet Protocol (VoIP) and IPTV. Newspaper publishing has been reshaped into Web sites, blogging, and web feeds. The Internet has enabled the creation of new forms of human communications through instant messaging, Internet forums, and social networking sites.

The Internet was created in the 1960s when the USA funded research projects of its military agencies decided to build forceful computer networks. Now the Internet has no centralized governance in **either** technological realization **or** policies for access and usage.

The terms Internet and World Wide Web are often used in everyday speech without much difference. However, the Internet and the World Wide Web are not one and the same. The Internet is a global data communications system. It is a hardware and software infrastructure that provides connectivity between

computers. In contrast, the Web is one of the services communicated via the Internet. It is a collection of interconnected documents and other resources, linked by hyperlinks and URLs.

to attach	приєднувати	strand	ланцюжок молекул

Researchers in Europe have unravelled a mystery that has been puzzling scientists for years: what happens to a molecule of DNA when it is stretched to its breaking point.

Now Erwin Peterman and his colleagues appear to have answered the question. The researchers carried out a DNA-stretching experiment by attaching one end of each strand of a length of double-stranded DNA to a polystyrene bead. The beads could be pulled apart with a controlled and measurable force by lasers – a process called optical tweezing.

"Pulling the DNA from both ends is a bit like pulling on a jacket that has a double-ended zipper," says Peterman. "What we found was that at the transition force the zipper starts to come apart at either end, but remains zipped in the middle. In other words, the DNA comes apart at either end, and under tension this single-stranded DNA is 70 percent longer than double-stranded DNA."

It is a great work. It tells us about the way the structure of a single molecule is changing under tension, something we have not been able to see before. It looks as though they have solved the question, but as always it is very complicated. So this might not be the end of the story.

The development of modern biotechnology is really a ground-breaking advance because of its enormous power to transform living things. New techniques such as tissue culture, cell culture and embryo transfer, as well as various techniques of molecular manipulation, have emerged. Transgenic technologies such as genetically modified organisms (GMOs) are now being widely used in crop breeding and commercial production.

There are a number of actual or potential benefits from GM crops. These include:

- Enhanced crop yield and productivity;
- More nutritious and higher quality products;
- Less need for pesticides and herbicides;
- Greater efficiency in resource management;
- Role as a bioreactor to produce raw materials for pharmaceuticals and other industries.

For critics, there are four main objections:

• Consumers do not have enough information about GMOs.

- There may be potential detrimental effects from eating GM foods, while there have not yet been objective studies to identify such effects, if they exist.
 - There may be unexpected environmental problems.
 - Using of GM crops may go against certain religious beliefs and traditions.

So, rapid introduction of GM products into the market is really amazing. Many of the key technologies are in the hands of the private sector, and dominated by a few companies. The use of transgenic modification could have benefits for developing countries only, due to an affordable cost.

So, there are some more problems of using these products.

- Many developing countries can not afford the cost of biotechnology.
- The crop genetic improvements that are currently available are not suitable for developing countries.
- The question is who will assist developing countries, and what type of assistance is appropriate.

Population growth and food distribution will most likely remain the two most critical problems which mankind must face **for many years to come**. **Biotechnology offers the potential to reduce uncertainty** in the world's future food supply, in the face of a growing population and the limited carrying capacity of the Earth.

Nanotechnology deals in the realm of the nearly invisible. The word comes from the Greek *nanos*, meaning "dwarf". But by most accounts, the technology's potential **is anything but** small. Scientists and engineers can now physically work with materials at the atomic level to create stain-proof fabrics, scratch-resistant paints and longer-lasting tennis balls. And researchers say new medical diagnostic tools and smaller, more efficient fuel cells and batteries based on nanoscience are on the way.

From computer chips invisible to the naked eye to microscopic machines that seek out and destroy cancers inside the human body, a lot of scientists argue that the potential of nanotechnology could be endless, but not without controversy.

"If we can get a nanoparticle into a cell, that might prove to be a new and useful drug delivery device," says Ms. Kulinowski, Executive Director of the Center for Biological and Environmental Nanotechnology at Rice University.

"On the other hand, it might prove to be a toxin to the cell either by punching a hole in the cell membrane or otherwise disrupting the cell's function".

Whether the benefits of nanotechnology outweigh the risks will determine the future of what many researchers hope will be the world's next industrial revolution.

The light from the sun comes in, and the greenhouse gases trap some of the heat radiated from the Earth. It's an energy balance. The more heat that comes in or the more heat that is trapped, the higher the energy balance is. The bigger the ice fields, the lower the Earth's energy balance.

A fundamental error is being spread that, because a global warming gas is transparent to a large amount of the incoming radiation from the sun, it cannot have much effect in terms of warming the planet. This is an error that ignores a real-world fact that incoming radiation is converted to longer wave-lengths as it impacts the atmosphere and the planetary surface. It is these longer wave-lengths that are then blanketed from escaping back into space. **If it were not for** this wave-length conversion (mechanism), the greenhouse gases (GHGs) **would** not be causing the rise in the level of the Earth's energy balance.

The energy balance for the Earth is about 33° Centigrade higher than it would otherwise be if there was no greenhouse effect. The average temperature on Earth is about 16° Centigrade. Thus, it would be more like -17° Centigrade, if there were no greenhouse gases in the atmosphere and, therefore, no greenhouse effect. The best estimate is for climate sensitivity to be 3°C. Values substantially higher than 4.5° C cannot be excluded.

I. Decide which of these statements are true and which are false.

1. Energy balance depends on heat level. 2. GHGs can not cause the rise in the level of the Earth's energy balance. 3. The average temperature on Earth is about 18° Celsius. 4. The best temperature for climate is 3° F.

II. Answer the following questions.

1. What is an energy balance? 2. What error information is spread all over the world? 3. What is the difference between a greenhouse effect and a global warming? 4. Is there any danger in the greenhouse effect?

That old cellphone gathering dust in your cupboard could help the economy go green, if only you could **get round to** recycling it. A UN report published last week says that too many of the rare metals that are essential for green technologies are locked up in old gadgets we throw away or forget about.

The report, from the United Nations Environment Programme, examined the recycling rates of 60 metals. Globally, 34 of them have recycling rates below 1 per cent, while only 18 have rates above 50 per cent. Among the least-recycled metals are tellurium and gallium – which are used in solar cells – and lithium, a key component of the batteries in electric cars – which is also found in cell-phone batteries.

These metals are not yet in heavy use, but will be crucial over the next few decades. While **we are unlikely to** run out of them in the near future, recycling those already in use is less energy-intensive than mining, offering a way to make the green technologies that rely on the metals even greener.

"Most metals can be used over and over again," says leading author Thomas Graedel of Yale University. But this doesn't happen, partly because electronic devices are not designed with recycling in mind, and partly because people hang onto their old gadgets for years. This hoarding mentality may be influenced by privacy concerns associated with selling or recycling old electronics that store personal information.

Part of the solution is to collect more metals for recycling, but Graedel says we also need to update our recycling technology. At the moment, about 70 per cent of the metal sent for recycling gets lost during the process.

hazardous	небезпечний	bot ([ro]bot) робот	
defusing	знешкодження	chore	рутинна робота
enhancement	удосконалення	dexterity	спритність

Ever since the Czech writer Karel Chapek first coined the term "robot" in 1921, there has been an expectation that robots would some day deliver us from the drudgery of hard work. The word – from the Czech "robota", for hard labour and servitude – described intelligent machines used as slaves in his play R.U.R. (Rossum's Universal Robots).

Today, over one million household robots, and a further 1.1 million industrial robots, are operating worldwide. Robots are used to perform tasks that require great levels of precision or are simply repetitive and boring. Many also do jobs that are hazardous to people, such as exploring shipwrecks, helping out after disasters, studying other planets and defusing bombs or mines.

Robots are increasingly marching into our lives. In the future, robots will act as carers, medics, bionic enhancements, companions, entertainers, security guards, traffic police and even soldiers.

Domestic invasion.

Despite the longevity of the robot concept, robotic butlers that roam our homes and relieve us from housework still seemed far from reality until very recently. Instead, the vast majority of robots worked in factories performing the industrial functions of brainless machines.

However, a combination of increased computing power and advances made in the field of artificial intelligence, or AI, have now made software smart enough to make robots considerably more useful.

A recent report published by the United Nations revealed that sales of domestic robots had tripled in a single year. What's more, they were well on their way to outstripping their industrial cousins.

While a large portion of the household robots were made up of robotic vacuum cleaners, mops, lawn mowers, pool cleaners, security bots and even robotic baby-rockers – the real boom was in entertainment robots.

Suddenly people were happy to pay for robots that had no specific functional value. Instead these bots, such as Sony's Aibo robotic dog and its robopups served as robo-pets and companions, rather than slaves.

This is partly because many domestic chores still pose a real challenge for robots, in terms of dexterity and intelligence, even with seemingly simple chores such as ironing.

A portrait of Madonna and the Child is one of Raphael's most famous Renaissance creations. Now it is in a gallery in Dresden, Germany. For many years people have wondered what the provenance of the work is. Laser Raman spectral analysis of three flecks of paint taken from the Raphael's canvas reveals that the unknown artist used a lead-based yellow pigment called massicot (lead II oxide). This is typical of the Renaissance period and it was not used in the early 17th century. There's historical evidence that massicot was one of the pigments used by Raphael himself.

Raman analysis is a very good technique for detecting pigments. Using scanning electron microscopy (energy dispersive x-ray microanalysis), scientists identified another yellow – lead-tin yellow – in some of Raphael's paintings at the gallery. But it is possible that the artist was also using other yellows.

Later, as the painting has aged, a miniature sketch of the composition has become visible beneath the Madonna's scarf. "It's undoubtedly an original in some form," Alan Ward said. Further research could confirm it. But it's unlikely there will ever be conclusive proof that Raphael was the artist. "The more evidence one gets about it, the more firm the conclusions that can be drawn," he said.

Text 20. How Much Arsenic do You Drink?

Active Vocabulary:

vegan	вегетаріанський	tolerance	допустима кількість
concern	турбота	sea-weed	морські водорості
derived	виведений, вироблений	to exceed	перевищувати
to investigate	досліджувати	barley	ячмінь
to consume	споживати	millet	просо
to increase	зростати	reduction	зниження
conscious	турботливий	incidence	частка, відсоток
to include	включати	cancer	рак

Sex, drugs, rocks, gold, murder, war, mass poisonings, the deaths of Napoleon, Tchaikovsky, Mozart, and others are all linked by one element – arsenic! Arsenic has been around since the beginning of time and the word has become a metaphor for poison with associated shock value.

But nowadays Japanese rice-based drinks are becoming a central part of Western diets, such as vegan diets. **However**, the levels of toxic inorganic arsenic contained in these types of drinks could, **in fact**, be cause for concern.

High levels of arsenic have recently been found in rice-based food. Now, researchers have found that some drinks and syrups contain high levels of arsenic too. "The rice-derived products we investigated are consumed by millions of people in Japan on a regular basis, and are increasingly becoming an important part of the diet of health conscious consumers in Western countries," says Signes-Pastor. **However**, regularly including these types of drinks in the diet could add as much as 23% of the daily tolerance level of arsenic.

Although in isolation this may not seem of massive concern, for people already taking high levels of arsenic from rice and sea-weed based products this could mean exceeding maximum daily tolerance levels.

Similar products derived from barley or millet contain much lower levels of arsenic and could be used as an alternative to the rice based drinks. This could be particularly important for people who already eat a lot of rice and sea-weed products.

The experiments showed that regulations for inorganic arsenic in foodstuffs and non-water drinks should be re-examined. Regulations for arsenic in foodstuffs and non-water drinks may lead to a reduction in the incidence of arsenic-attributable diseases, including various cancers.

I. Decide which of these statements are true and which are false.

1. Toxic inorganic arsenic could cause cancer. 2. The rice-derived products consumed by millions of people on a regular basis are less important part of the diet of health conscious consumers. 3. The products derived from barley and millet contain much more arsenic than rice-based food. 4. Contemporary regulations for inorganic arsenic in foodstuffs and non-water drinks should be admitted.

II. Answer the following questions.

1. What do you know about vegan diets? 2. What food contains high levels of arsenic? 3. Why is arsenic dangerous? 4. What should scientists do in order to protect people against arsenic-attributable diseases?
